1 Introduction

- Lesson Objectives 1-2
- Course Objectives 1-3
- Human Resources (HR) Schema for This Course 1-4
- Course Agenda 1-5
- Class Account Information 1-6
- Appendices and Practices Used in This Course 1-7
- PL/SQL Development Environments 1-8
- What Is Oracle SQL Developer? 1-9
- Coding PL/SQL in SQL*Plus 1-10
- Introduction to Oracle Cloud 1-11
- Oracle Cloud Services 1-12
- Cloud Deployment Models 1-13
- Oracle SQL and PL/SQL Documentation 1-14
- Summary 1-15
- Practice 1 Overview: Getting Started 1-16

2 Introduction to PL/SQL

- Objectives 2-2
- Agenda 2-3
- About PL/SQL 2-4
- PL/SQL Run-Time Architecture 2-6
- Benefits of PL/SQL 2-7
- PL/SQL Block Structure 2-10
- Agenda 2-12
- Block Types 2-13
- Program Constructs 2-15
- Examining an Anonymous Block 2-17
- Executing an Anonymous Block 2-18
- Agenda 2-19
- Enabling Output of a PL/SQL Block 2-20
- Viewing the Output of a PL/SQL Block 2-21
- Quiz 2-22
- Summary 2-23
- Practice 2: Overview 2-24

3 Declaring PL/SQL Variables

Objectives 3-2
Agenda 3-3
Use of Variables 3-4
Requirements for Variable Names 3-5
Handling Variables in PL/SQL 3-6
Declaring and Initializing PL/SQL Variables 3-7
Delimiters in String Literals 3-9
Agenda 3-10
Types of Variables 3-11
Guidelines for Declaring and Initializing PL/SQL Variables 3-13
Guidelines for Declaring PL/SQL Variables 3-14
Naming Conventions of PL/SQL Structures Used in This Course 3-15
Scalar Data Types 3-16
Base Scalar Data Types 3-17
Declaring Scalar Variables 3-21
%TYPE Attribute 3-22
Declaring Variables with the %TYPE Attribute 3-24
Declaring Boolean Variables 3-25
LOB Data Type Variables 3-26
Composite Data Types: Records and Collections 3-27
Agenda 3-28
Bind Variables 3-29
Referencing Bind Variables 3-31
Using AUTOPRINT with Bind Variables 3-32
Quiz 3-33
Summary 3-34
Practice 3: Overview 3-35

4 Writing Executable Statements

Objectives 4-2
Agenda 4-3
Lexical Units in a PL/SQL Block 4-4
PL/SQL Block Syntax and Guidelines 4-6
Commenting Code 4-7
SQL Functions in PL/SQL 4-8
SQL Functions in PL/SQL: Examples 4-9
Using Sequences in PL/SQL Expressions 4-10
Data Type Conversion 4-11
Agenda 4-14

Nested Blocks 4-15
Nested Blocks: Example 4-16
Variable Scope and Visibility 4-17
Using a Qualifier with Nested Blocks 4-19
Challenge: Determining Variable Scope 4-20
Agenda 4-22
Operators in PL/SQL 4-23
Operators in PL/SQL: Examples 4-24
Programming Guidelines 4-25
Indenting Code 4-26
Quiz 4-27
Summary 4-28
Practice 4: Overview 4-29

5 Using SQL Statements within a PL/SQL Block

Objectives 5-2
Agenda 5-3
SQL Statements in PL/SQL 5-4
SELECT Statements in PL/SQL 5-5
Retrieving Data in PL/SQL: Example 5-9
Retrieving Data in PL/SQL 5-10
Naming Ambiguities 5-11
Naming Conventions 5-12
Agenda 5-13
Using PL/SQL to Manipulate Data 5-14
Inserting Data: Example 5-15
Updating Data: Example 5-16
Deleting Data: Example 5-17
Merging Rows 5-18
Agenda 5-20
SQL Cursor 5-21
SQL Cursor Attributes for Implicit Cursors 5-23
Quiz 5-25
Summary 5-26
Practice 5: Overview 5-27

6 Writing Control Structures

Objectives 6-2
Controlling Flow of Execution 6-3
Agenda 6-4
IF Statement 6-5

Simple IF Statement 6-7
IF THEN ELSE Statement 6-8
IF ELSIF ELSE Clause 6-9
NULL Value in IF Statement 6-10
Agenda 6-11
CASE Expressions 6-12
CASE Expressions: Example 6-13
Searched CASE Expressions 6-14
CASE Statement 6-15
Handling Nulls 6-16
Logic Tables 6-17
Boolean Expressions or Logical Expression? 6-18
Agenda 6-19
Iterative Control: LOOP Statements 6-20
Basic Loops 6-21
Basic Loop: Example 6-22
WHILE Loops 6-23
WHILE Loops: Example 6-24
FOR Loops 6-25
FOR Loops: Example 6-27
FOR Loop Rules 6-28
Suggested Use of Loops 6-29
Nested Loops and Labels 6-30
Nested Loops and Labels: Example 6-31
PL/SQL CONTINUE Statement 6-32
PL/SQL CONTINUE Statement: Example 1 6-33
PL/SQL CONTINUE Statement: Example 2 6-34
Quiz 6-35
Summary 6-36
Practice 6: Overview 6-37

7 Working with Composite Data Types

Objectives 7-2
Agenda 7-3
Composite Data Types 7-4
PL/SQL Records or Collections? 7-5
Agenda 7-6
PL/SQL Records 7-7
Creating a PL/SQL Record 7-8
PL/SQL Record Structure 7-9
%ROWTYPE Attribute 7-10

Creating a PL/SQL Record: Example	7-12
Advantages of Using the %ROWTYPE Attribute	7-13
Another %ROWTYPE Attribute Example	7-14
Inserting a Record by Using %ROWTYPE	7-15
Updating a Row in a Table by Using a Record	7-16
Agenda	7-17
Associative Arrays (INDEX BY Tables)	7-18
Associative Array Structure	7-19
Steps to Create an Associative Array	7-20
Creating and Accessing Associative Arrays	7-21
Using INDEX BY Table Methods	7-22
INDEX BY Table of Records Option	7-23
INDEX BY Table of Records Option: Example 2	7-24
Nested Tables	7-25
VARRAY	7-27
Summary of Collection Types	7-28
Quiz	7-29
Summary	7-30
Practice 7: Overview	7-31

8 Using Explicit Cursors

Objectives	8-2
Agenda	8-3
Cursors	8-4
Explicit Cursor Operations	8-5
Controlling Explicit Cursors	8-6
Agenda	8-7
Declaring the Cursor	8-8
Opening the Cursor	8-10
Fetching Data from the Cursor	8-11
Closing the Cursor	8-14
Cursors and Records	8-15
Cursor FOR Loops	8-16
Explicit Cursor Attributes	8-18
%ISOPEN Attribute	8-19
%ROWCOUNT and %NOTFOUND: Example	8-20
Cursor FOR Loops Using Subqueries	8-21
Agenda	8-22
Cursors with Parameters	8-23
Agenda	8-25
FOR UPDATE Clause	8-26

WHERE CURRENT OF Clause 8-28
Quiz 8-29
Summary 8-30
Practice 8: Overview 8-31

9 Handling Exceptions

Objectives 9-2
Agenda 9-3
What Is an Exception? 9-4
Handling the Exception: An Example 9-5
Understanding Exceptions with PL/SQL 9-6
Handling Exceptions 9-7
Exception Types 9-8
Agenda 9-9
Syntax to Trap Exceptions 9-10
Guidelines for Trapping Exceptions 9-12
Trapping Predefined Oracle Server Errors 9-13
Trapping Nonpredefined Oracle Server Errors 9-16
Nonpredefined Error Trapping: Example 9-17
Functions for Trapping Exceptions 9-18
Trapping User-Defined Exceptions 9-20
Propagating Exceptions in a Subblock 9-22
The RAISE Statement 9-23
RAISE_APPLICATION_ERROR Procedure 9-24
Quiz 9-27
Summary 9-28
Practice 9: Overview 9-29

10 Introducing Stored Procedures and Functions

Objectives 10-2
Agenda 10-3
Procedures and Functions 10-4
Differences Between Anonymous Blocks and Subprograms 10-5
Agenda 10-6
Procedure: Syntax 10-7
Creating a Procedure 10-8
Invoking a Procedure 10-10
Agenda 10-11
Function: Syntax 10-12
Creating a Function 10-13
Invoking a Function 10-14

- Passing a Parameter to the Function 10-15
- Invoking the Function with a Parameter 10-16
- Quiz 10-17
- Summary 10-18
- Practice 10: Overview 10-19

Appendix A: Table Descriptions and Data

Appendix B: Using SQL Developer

- Objectives B-2
- What Is Oracle SQL Developer? B-3
- Specifications of SQL Developer B-4
- SQL Developer 3.2 Interface B-5
- Creating a Database Connection B-7
- Browsing Database Objects B-10
- Displaying the Table Structure B-11
- Browsing Files B-12
- Creating a Schema Object B-13
- Creating a New Table: Example B-14
- Using the SQL Worksheet B-15
- Executing SQL Statements B-19
- Saving SQL Scripts B-20
- Executing Saved Script Files: Method 1 B-21
- Executing Saved Script Files: Method 2 B-22
- Formatting the SQL Code B-23
- Using Snippets B-24
- Using Snippets: Example B-25
- Debugging Procedures and Functions B-26
- Database Reporting B-27
- Creating a User-Defined Report B-28
- Search Engines and External Tools B-29
- Setting Preferences B-30
- Resetting the SQL Developer Layout B-32
- Data Modeler in SQL Developer B-33
- Summary B-34

Appendix C: Using SQL*Plus

- Objectives C-2
- SQL and SQL*Plus Interaction C-3
- SQL Statements Versus SQL*Plus Commands C-4
- Overview of SQL*Plus C-5

Logging In to SQL*Plus	C-6
Displaying the Table Structure	C-7
SQL*Plus Editing Commands	C-9
Using LIST, n, and APPEND	C-11
Using the CHANGE Command	C-12
SQL*Plus File Commands	C-13
Using the SAVE, START Commands	C-14
SERVEROUTPUT Command	C-15
Using the SQL*Plus SPOOL Command	C-16
Using the AUTOTRACE Command	C-17
Summary	C-18

Appendix D: Commonly Used SQL Commands

Objectives	D-2
Basic SELECT Statement	D-3
SELECT Statement	D-4
WHERE Clause	D-5
ORDER BY Clause	D-6
GROUP BY Clause	D-7
Data Definition Language	D-8
CREATE TABLE Statement	D-9
ALTER TABLE Statement	D-10
DROP TABLE Statement	D-11
GRANT Statement	D-12
Privilege Types	D-13
REVOKE Statement	D-14
TRUNCATE TABLE Statement	D-15
Data Manipulation Language	D-16
INSERT Statement	D-17
UPDATE Statement Syntax	D-18
DELETE Statement	D-19
Transaction Control Statements	D-20
COMMIT Statement	D-21
ROLLBACK Statement	D-22
SAVEPOINT Statement	D-23
Joins	D-24
Types of Joins	D-25
Qualifying Ambiguous Column Names	D-26
Natural Join	D-27
Equijoins	D-28
Retrieving Records with Equijoins	D-29

Additional Search Conditions Using the AND and WHERE Operators	D-30
Retrieving Records with Nonequijoins	D-31
Retrieving Records by Using the USING Clause	D-32
Retrieving Records by Using the ON Clause	D-33
Left Outer Join	D-34
Right Outer Join	D-35
Full Outer Join	D-36
Self-Join: Example	D-37
Cross Join	D-38
Summary	D-39

Appendix E: REF Cursors

Cursor Variables	E-2
Using Cursor Variables	E-3
Defining REF CURSOR Types	E-4
Using the OPEN-FOR, FETCH, and CLOSE Statements	E-7
Example of Fetching	E-10

Introduction

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Lesson Objectives

After completing this lesson, you should be able to do the following:

- Discuss the goals of the course
- Describe the HR database schema that is used in this course
- Identify the available user interface environments that can be used in this course
- Describe the salient features of Oracle Cloud
- Reference the available appendixes, documentation, and other resources

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This lesson gives you a high-level overview of the course and its flow. You learn about the database schema and the tables that the course uses. The course introduces you to Oracle Cloud and components such as SQL, PL/SQL, and compilation features. The course also introduces you to tools such as SQL Developer used in this course.

Course Objectives

After completing this course, you should be able to do the following:

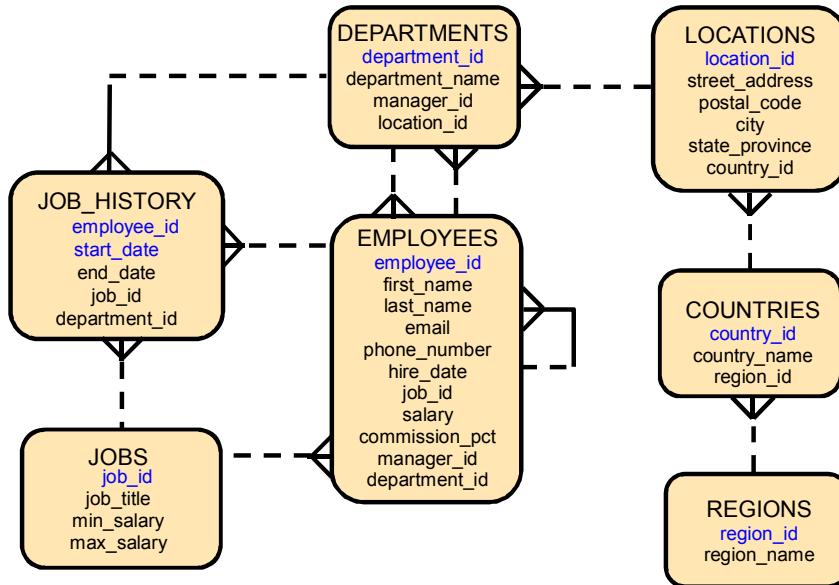

- Identify the programming extensions that PL/SQL provides to SQL
- Write PL/SQL code to interface with the database
- Design PL/SQL anonymous blocks that execute efficiently
- Use PL/SQL programming constructs and conditional control statements
- Handle run-time errors
- Describe stored procedures and functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This course presents the basics of PL/SQL. You learn about PL/SQL syntax, blocks, and programming constructs and also about the advantages of integrating SQL with those constructs. You learn how to write PL/SQL program units and execute them efficiently. In addition, you learn how to use SQL Developer as a development environment for PL/SQL. You also learn how to design reusable program units such as procedures and functions.

Human Resources (HR) Schema for This Course

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The Human Resources (HR) schema is part of the Oracle Sample Schemas that can be installed in an Oracle database. The practice sessions in this course use data from the HR schema.

Table Descriptions

- REGIONS contains rows that represent a region such as the Americas or Asia.
- COUNTRIES contains rows for countries, each of which is associated with a region.
- LOCATIONS contains the specific address of a specific office, warehouse, or production site of a company in a particular country.
- DEPARTMENTS shows details about the departments in which employees work. Each department may have a relationship representing the department manager in the EMPLOYEES table.
- EMPLOYEES contains details about each employee working for a department. Some employees may not be assigned to any department.
- JOBS contains the job types that can be held by each employee.
- JOB_HISTORY contains the job history of the employees. If an employee changes departments within a job or changes jobs within a department, a new row is inserted into this table with the old job information of the employee.

Course Agenda

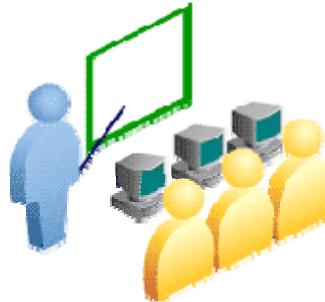

- Day 1:
 1. Introduction
 2. Introduction to PL/SQL
 3. Declaring PL/SQL Variables
 4. Writing Executable Statements
 5. Using SQL Statements within a PL/SQL
 6. Writing Control Structures
- Day 2:
 7. Working with Composite Data Types
 8. Using Explicit Cursors
 9. Handling Exceptions
 10. Introducing Stored Procedures and Functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Class Account Information

- A cloned HR account ID is set up for you.
- Your account ID is ora41.
- The password matches your account ID.
- Each machine has its own complete environment, and is assigned the same account.

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Appendices and Practices Used in This Course

- Appendix A: Table Descriptions and Data
- Appendix B: Using SQL Developer
- Appendix C: Using SQL*Plus
- Appendix D: Commonly Used SQL Commands
- Appendix E: REF Cursors
- Activity Guide: Practices and Solutions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL Development Environments

This course setup provides the following tools for developing PL/SQL code:

- Oracle SQL Developer (used in this course)
- Oracle SQL*Plus

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

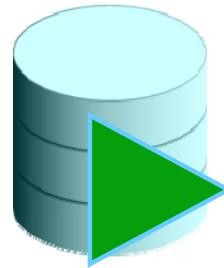

Oracle provides several tools that can be used to write PL/SQL code. Some of the development tools that are available for use in this course:

- **Oracle SQL Developer:** A graphical tool
- **Oracle SQL*Plus:** A window or command-line application

Note: The code and screen examples presented in the course notes were generated from output in the SQL Developer environment.

What Is Oracle SQL Developer?

- Oracle SQL Developer is a free graphical tool that enhances productivity and simplifies database development tasks.
- You can connect to any target Oracle database schema by using standard Oracle database authentication.
- You use SQL Developer in this course.
- Appendix B contains details about using SQL Developer.

SQL Developer

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Oracle SQL Developer is a free graphical tool designed to improve your productivity and simplify the development of everyday database tasks. With just a few clicks, you can easily create and maintain stored procedures, test SQL statements, and view optimizer plans.

SQL Developer, the visual tool for database development, simplifies the following tasks:

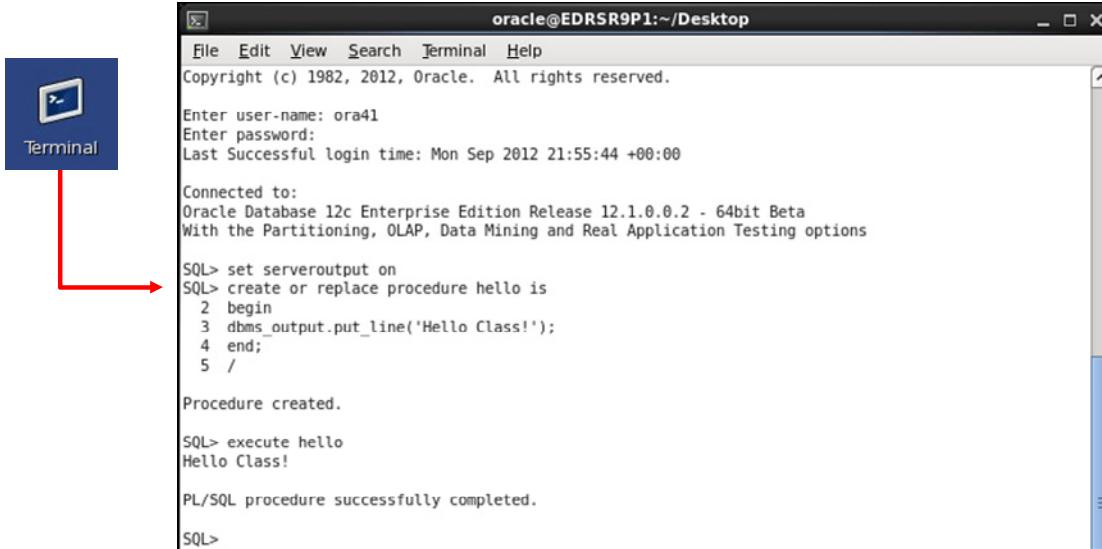

- Browsing and managing database objects
- Executing SQL statements and scripts
- Editing and debugging PL/SQL statements
- Creating reports

You can connect to any target Oracle database schema by using standard Oracle database authentication. When you are connected, you can perform operations on objects in the database.

Appendix B

Appendix B of this course provides an introduction on using the SQL Developer interface. Refer to the appendix for information about creating a database connection, interacting with data using SQL and PL/SQL, and more. Alternatively, you can also view the introduction to SQL Developer demonstration.

Coding PL/SQL in SQL*Plus

Oracle SQL*Plus is a command-line interface that enables you to submit SQL statements and PL/SQL blocks for execution and receive the results in an application or a command window.

SQL*Plus is:

- Shipped with the database
- Installed on a client and on the database server system
- Accessed using an icon or the command line

When you code PL/SQL subprograms using SQL*Plus, remember the following:

- You create subprograms by using the CREATE SQL statement.
- You execute subprograms by using either an anonymous PL/SQL block or the EXECUTE command.
- If you use the DBMS _OUTPUT package procedures to print text to the screen, you must first execute the SET SERVEROUTPUT ON command in your session.

Note

- To launch SQL*Plus in Linux environment, open a Terminal window and enter the command: sqlplus.
- For more information about using SQL*Plus, see Appendix C.

Introduction to Oracle Cloud

The Oracle Cloud is an enterprise cloud for business. The Oracle Public Cloud consists of many different services which share some common characteristics :

- On-demand self-service
- Resource pooling
- Rapid elasticity
- Measured service
- Broad network access

www.cloud.oracle.com

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The Oracle Cloud is an enterprise cloud for business. It provides an integrated collection of application and platform cloud services that are based upon best-in-class products and open Java and SQL standards.

As a result, the applications and databases deployed in the Oracle Cloud are portable and can be easily moved to or from a private cloud or an on-premise environment.

- All Cloud Services can be provisioned through a self-service interface. Users can get their Cloud Services delivered on an integrated development and deployment platform with tools to rapidly extend and create new services. Oracle Cloud services are built on the Oracle Exalogic Elastic Cloud and Oracle Exadata Database Machine, together offering a platform that delivers extreme performance, redundancy, and scalability. The top two benefits of cloud computing are speed and cost.

The five essential characteristics are:

- **On-demand self-service:** Provisioning, monitoring, management control
- **Resource pooling:** Implies sharing and a level of abstraction between consumers and services
- **Rapid elasticity:** The ability to quickly scale up or down as needed
- **Measured service:** Metering utilization for either internal chargeback (private cloud) or external billing (public cloud)
- **Broad network access:** Typically means access through a browser on any networked device

Oracle Cloud Services

Oracle Cloud provides the following three types of services:

- Software as a Service (SaaS)
- Platform as a Service (PaaS)
- Infrastructure as a Service (IaaS)

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Software as a Service (SaaS) generally refers to applications that are delivered to end users over the Internet. Oracle CRM On Demand is an example of a SaaS offering that provides both multitenant as well as single-tenant options, depending on the customer's preferences.

Platform as a Service (PaaS) generally refers to an application development and deployment platform delivered as a service to developers, enabling them to quickly build and deploy a SaaS application to end users. The platform typically includes databases, middleware, and development tools, all delivered as a service via the Internet.

Infrastructure as a Service (IaaS) refers to computing hardware (servers, storage, and network) delivered as a service. This typically includes the associated software as well as operating systems, virtualization, clustering, and so on. Examples of IaaS in the public cloud include Amazon's Elastic Compute Cloud (EC2) and Simple Storage Service (S3).

The database cloud is built within an enterprise's private cloud environment, as a PaaS model. The database cloud provides on-demand access to database services in a self-service, elastically scalable, and metered manner. The database cloud offers compelling advantages in cost, quality of service, and agility. A database can also be deployed within a virtual machine in an IaaS platform.

Database clouds can be rapidly deployed on Oracle Exadata, a preintegrated and optimized hardware platform that supports both OLTP and DW workloads.

Cloud Deployment Models

- **Private cloud:** For exclusive use by a single organization; typically controlled, managed, and hosted in private data centers
- **Public cloud:** For use by multiple organizations (tenants) on a shared basis; hosted and managed by a third-party service provider
- **Community cloud:** For use by a group of related organizations which want to make use of a common cloud computing environment
- **Hybrid cloud:** For use by a single organization that wants to adopt both private and public clouds for a single application to take advantage of the benefits of both

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Private Cloud

The hosting and operation of private clouds may also be outsourced to a third-party service provider, but a private cloud remains for the exclusive use of one organization.

Community Cloud

Example: A community might consist of the different branches of the military, all the universities in a given region, or all the suppliers to a large manufacturer.

Hybrid Cloud

Example: In a “cloud bursting” scenario, an organization might run the steady-state workload of an application on a private cloud. But when a spike in workload occurs (such as at the end of the financial quarter or during the holiday season), the application can burst out to use computing capacity from a public cloud, and then return those resources to the public pool when they are no longer needed.

Oracle SQL and PL/SQL Documentation

Navigate to <http://www.oracle.com/pls/db112/homepage> to access the Oracle Database 11g documentation library.

Navigate to <http://www.oracle.com/pls/db102/homepage> to access the Oracle Database 10g documentation library.

Summary

In this lesson, you should have learned how to:

- Discuss the goals of the course
- Describe the HR database schema that is used in the course
- Identify the available user interface environments that can be used in this course
- Reference the available appendixes, documentation, and other resources

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Practice 1 Overview: Getting Started

This practice covers the following topics:

- Starting SQL Developer
- Creating a new database connection
- Browsing the HR schema tables
- Setting a SQL Developer preference

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this practice, you use SQL Developer to execute SQL statements to examine data in the HR schema. You also create a simple anonymous block.

Note: All written practices use SQL Developer as the development environment. Although it is recommended that you use SQL Developer, you can also use the SQL*Plus environment that is available in this course.

2

Introduction to PL/SQL

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Explain the need for PL/SQL
- Explain the benefits of PL/SQL
- Identify the different types of PL/SQL blocks
- Output messages in PL/SQL

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This lesson introduces PL/SQL and the PL/SQL programming constructs. You also learn about the benefits of PL/SQL.

Agenda

- Understanding the benefits and structure of PL/SQL
- Examining PL/SQL blocks
- Generating output messages in PL/SQL

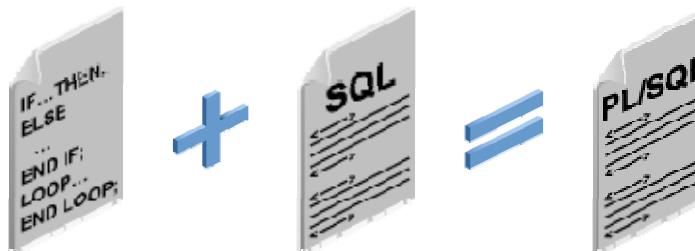

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

About PL/SQL

PL/SQL:

- Stands for “Procedural Language extension to SQL”
- Is Oracle Corporation’s standard data access language for relational databases
- Seamlessly integrates procedural constructs with SQL

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Structured Query Language (SQL) is the primary language used to access and modify data in relational databases. There are only a few SQL commands, so you can easily learn and use them.

Consider an example:

```
SELECT first_name, department_id, salary FROM employees;
```

The preceding SQL statement is simple and straightforward. However, if you want to alter any data that is retrieved in a conditional manner, you soon encounter the limitations of SQL.

Consider a slightly modified problem statement: For every employee retrieved, check the department ID and salary. Depending on the department’s performance and also the employee’s salary, you may want to provide varying bonuses to the employees.

Looking at the problem, you know that you have to execute the preceding SQL statement, collect the data, and apply logic to the data.

- One solution is to write a SQL statement for each department to give bonuses to the employees in that department. Remember that you also have to check the salary component before deciding the bonus amount. This makes it a little complicated.
- A more effective solution might include conditional statements. PL/SQL is designed to meet such requirements. It provides a programming extension to the already-existing SQL.

About PL/SQL

PL/SQL:

- Provides a block structure for executable units of code. Maintenance of code is made easier with such a well-defined structure.
- Provides procedural constructs such as:
 - Variables, constants, and data types
 - Control structures such as conditional statements and loops
 - Reusable program units that are written once and executed many times

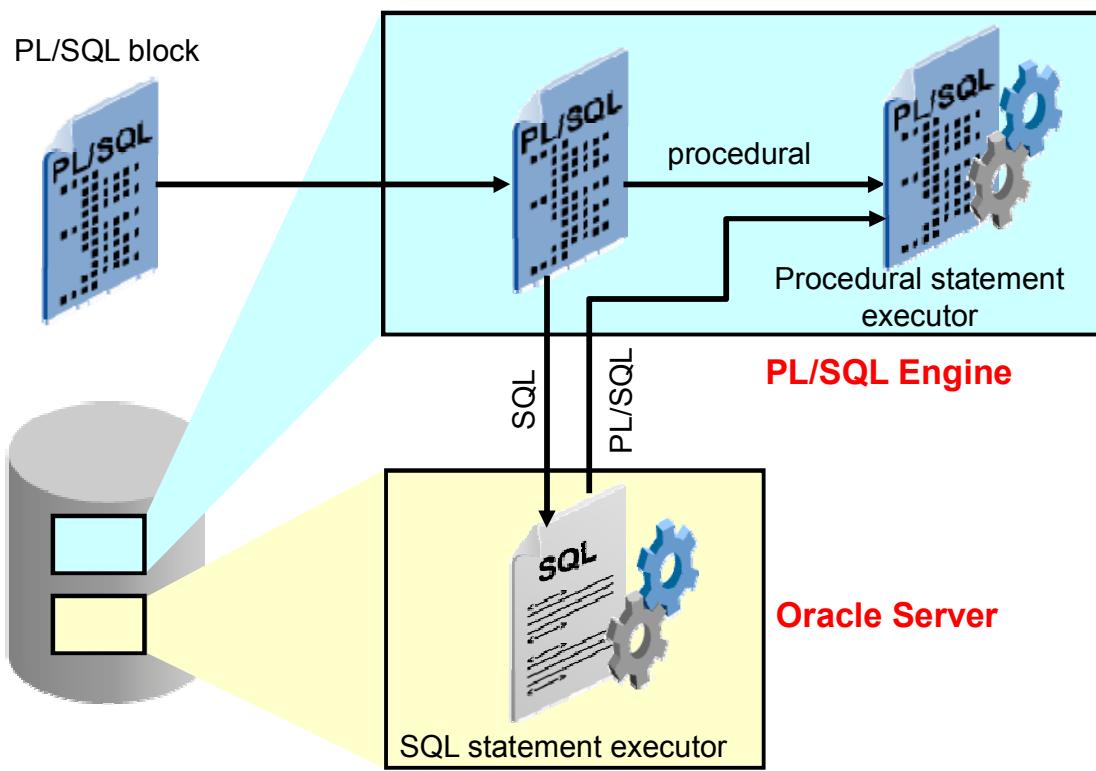

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL defines a block structure for writing code. Maintaining and debugging code is made easier with such a structure because you can easily understand the flow and execution of the program unit.

PL/SQL offers modern software engineering features such as data encapsulation, exception handling, information hiding, and object orientation. It brings state-of-the-art programming to the Oracle Server and toolset. PL/SQL provides all the procedural constructs that are available in any third-generation language (3GL).

PL/SQL Run-Time Architecture

The diagram in the slide shows a PL/SQL block being executed by the PL/SQL engine. The PL/SQL engine resides in:

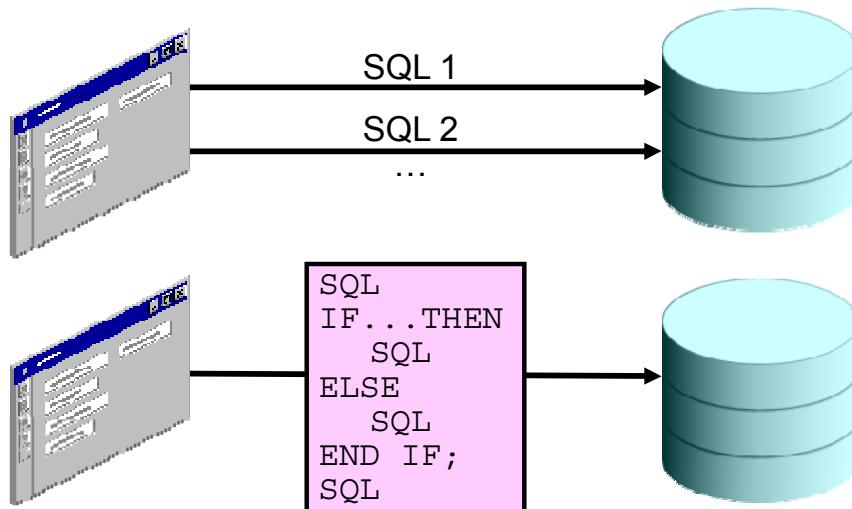

- The Oracle database for executing stored subprograms
- The Oracle Forms client when you run client/server applications, or in the Oracle Application Server when you use Oracle Forms Services to run Forms on the web

Irrespective of the PL/SQL run-time environment, the basic architecture remains the same. Therefore, all PL/SQL statements are processed in the Procedural Statement Executor, and all SQL statements must be sent to the SQL Statement Executor for processing by the Oracle Server processes. The SQL environment may also invoke the PL/SQL environment. For example, the PL/SQL environment is invoked when a PL/SQL function is used in a SELECT statement.

The PL/SQL engine is a virtual machine that resides in memory and processes the PL/SQL m-code instructions. When the PL/SQL engine encounters a SQL statement, a context switch is made to pass the SQL statement to the Oracle Server processes. The PL/SQL engine waits for the SQL statement to complete and for the results to be returned before it continues to process subsequent statements in the PL/SQL block. The Oracle Forms PL/SQL engine runs in the client for the client/server implementation, and in the application server for the Forms Services implementation. In either case, SQL statements are typically sent over a network to an Oracle Server for processing.

Benefits of PL/SQL

- Integration of procedural constructs with SQL
- Improved performance

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- **Integration of procedural constructs with SQL:** The most important advantage of PL/SQL is the integration of procedural constructs with SQL. SQL is a nonprocedural language. When you issue a SQL command, your command tells the database server *what* to do. However, you cannot specify *how* to do it. PL/SQL integrates control statements and conditional statements with SQL, giving you better control of your SQL statements and their execution. Earlier in this lesson, you saw an example of the need for such integration.
- **Improved performance:** Without PL/SQL, you would not be able to logically combine SQL statements as one unit. If you have designed an application that contains forms, you may have many different forms with fields in each form. When a form submits data, you may have to execute a number of SQL statements. SQL statements are sent to the database one at a time. This results in many network trips and one call to the database for each SQL statement, thereby increasing network traffic and reducing performance (especially in a client/server model).

With PL/SQL, you can combine all these SQL statements into a single program unit. The application can send the entire block to the database instead of sending the SQL statements one at a time. This significantly reduces the number of database calls. As the slide illustrates, if the application is SQL intensive, you can use PL/SQL blocks to group SQL statements before sending them to the Oracle database server for execution.

Benefits of PL/SQL

- Modularized program development
- Integration with Oracle tools
- Portability
- Exception handling

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- **Modularized program development:** The basic unit in all PL/SQL programs is the block. Blocks can be in a sequence or they can be nested in other blocks. Modularized program development has the following advantages:
 - You can group logically related statements within blocks.
 - You can nest blocks inside larger blocks to build powerful programs.
 - You can break your application into smaller modules. If you are designing a complex application, PL/SQL allows you to break down the application into smaller, manageable, and logically related modules.
 - You can easily maintain and debug code.In PL/SQL, modularization is implemented using procedures, functions, and packages, which are discussed in the lesson titled “Introducing Stored Procedures and Functions.”
- **Integration with tools:** The PL/SQL engine is integrated in Oracle tools such as Oracle Forms and Oracle Reports. When you use these tools, the locally available PL/SQL engine processes the procedural statements; only the SQL statements are passed to the database.

- **Portability:** PL/SQL programs can run anywhere an Oracle Server runs, irrespective of the operating system and platform. You do not need to customize them to each new environment. You can write portable program packages and create libraries that can be reused in different environments.
- **Exception handling:** PL/SQL enables you to handle exceptions efficiently. You can define separate blocks for dealing with exceptions. You learn more about exception handling in the lesson titled “Handling Exceptions.”

PL/SQL shares the same data type system as SQL (with some extensions) and uses the same expression syntax.

PL/SQL Block Structure

- **DECLARE** (optional)
 - Variables, cursors, user-defined exceptions
- **BEGIN** (mandatory)
 - SQL statements
 - PL/SQL statements
- **EXCEPTION** (optional)
 - Actions to perform when exceptions occur
- **END;** (mandatory)

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide shows a basic PL/SQL block. A PL/SQL block consists of four sections:

- **Declarative (optional):** The declarative section begins with the keyword **DECLARE** and ends when the executable section starts.
- **Begin (required):** The executable section begins with the keyword **BEGIN**. This section needs to have at least one statement. However, the executable section of a PL/SQL block can include any number of PL/SQL blocks.
- **Exception handling (optional):** The exception section is nested within the executable section. This section begins with the keyword **EXCEPTION**.
- **End (required):** All PL/SQL blocks must conclude with an **END** statement. Observe that **END** is terminated with a semicolon.

In a PL/SQL block, the keywords `DECLARE`, `BEGIN`, and `EXCEPTION` are not terminated by a semicolon. However, the keyword `END`, all SQL statements, and PL/SQL statements must be terminated with a semicolon.

Section	Description	Inclusion
Declarative (<code>DECLARE</code>)	Contains declarations of all variables, constants, cursors, and user-defined exceptions that are referenced in the executable and exception sections	Optional
Executable (<code>BEGIN ... END</code>)	Contains SQL statements to retrieve data from the database; contains PL/SQL statements to manipulate data in the block	Mandatory
Exception (<code>EXCEPTION</code>)	Specifies the actions to perform when errors and abnormal conditions arise in the executable section	Optional

Agenda

- Understanding the benefits and structure of PL/SQL
- Examining PL/SQL blocks
- Generating output messages in PL/SQL

A PL/SQL program comprises one or more blocks. These blocks can be entirely separate or nested within another block.

There are three types of blocks that make up a PL/SQL program:

- Anonymous blocks
- Procedures
- Functions

Anonymous blocks: Anonymous blocks are unnamed blocks. They are declared inline at the point in an application where they are to be executed and are compiled each time the application is executed. These blocks are not stored in the database. They are passed to the PL/SQL engine for execution at run time. Triggers in Oracle Developer components consist of such blocks.

If you want to execute the same block again, you have to rewrite the block. You cannot invoke or call the block that you wrote earlier because blocks are anonymous and do not exist after they are executed.

Procedures: Procedures are named objects that contain SQL and/or PL/SQL statements.

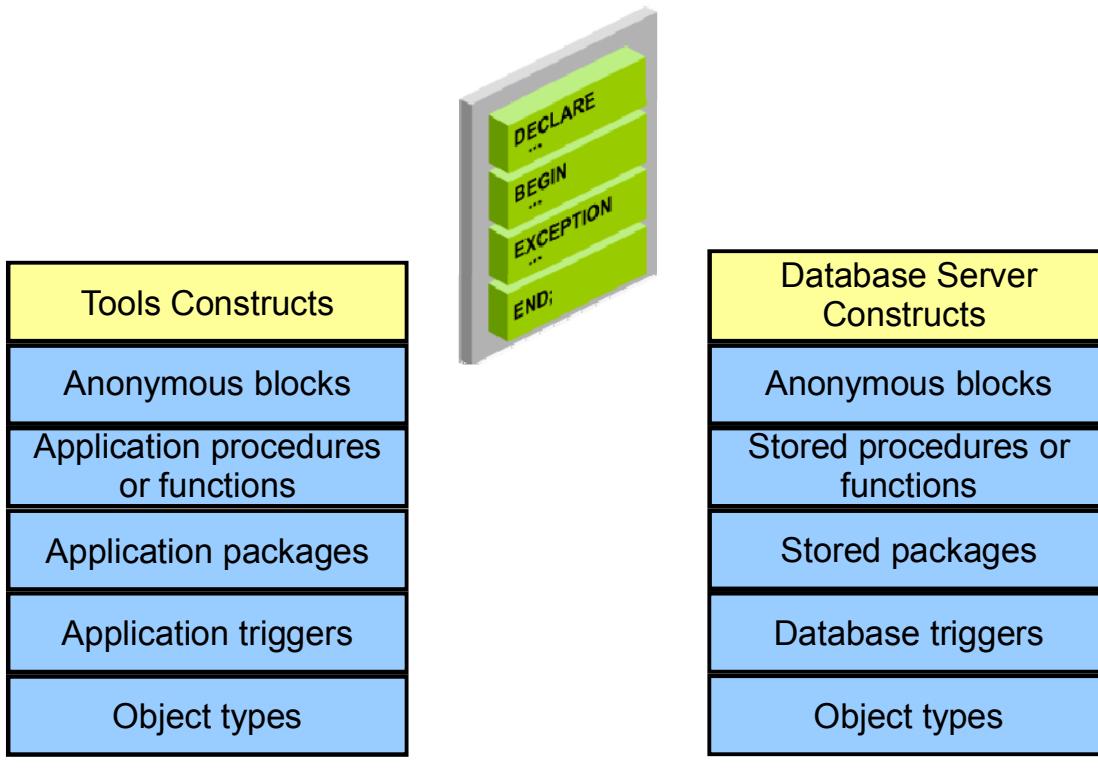

Functions: Functions are named objects that contain SQL and/or PL/SQL statements. Unlike a procedure, a function returns a value of a specified data type.

Subprograms

Subprograms are complementary to anonymous blocks. They are named PL/SQL blocks that are stored in the database. Because they are named and stored, you can invoke them whenever you want (depending on your application). You can declare them either as procedures or as functions. You typically use a procedure to perform an action and a function to compute and return a value.

Subprograms can be stored at the server or application level. Using Oracle Developer components (Forms, Reports), you can declare procedures and functions as part of the application (a form or report) and call them from other procedures, functions, and triggers within the same application, whenever necessary.

Program Constructs

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

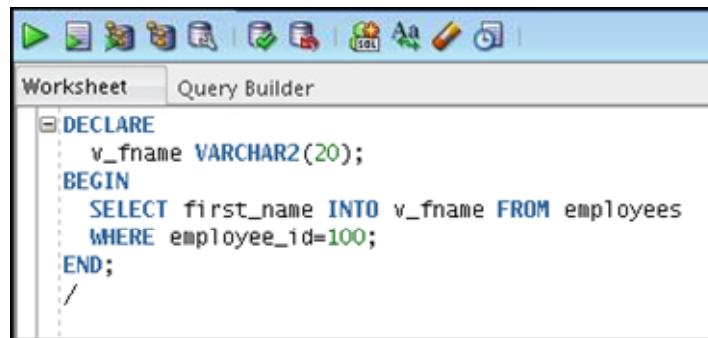

The following table outlines a variety of PL/SQL program constructs that use the basic PL/SQL block. The program constructs are available based on the environment in which they are executed.

Program Construct	Description	Availability
Anonymous blocks	Unnamed PL/SQL blocks that are embedded within an application or are issued interactively	All PL/SQL environments
Application procedures or functions	Named PL/SQL blocks that are stored in an Oracle Forms Developer application or a shared library; can accept parameters and can be invoked repeatedly by name	Oracle Developer tools components (for example, Oracle Forms Developer, Oracle Reports)
Stored procedures or functions	Named PL/SQL blocks that are stored in the Oracle server; can accept parameters and can be invoked repeatedly by name	Oracle server or Oracle Developer tools
Packages (application or stored)	Named PL/SQL modules that group related procedures, functions, and identifiers	Oracle server and Oracle Developer tools components (for example, Oracle Forms Developer)

Program Construct	Description	Availability
Database triggers	PL/SQL blocks that are associated with a database table and are fired automatically when triggered by various events	Oracle server or any Oracle tool that issues the DML
Application triggers	PL/SQL blocks that are associated either with a database table or system events. They are fired automatically when triggered by a DML or a system event respectively.	Oracle Developer tools components (for example, Oracle Forms Developer)
Object types	User-defined composite data types that encapsulate a data structure along with the functions and procedures needed to manipulate data	Oracle server and Oracle Developer tools

Examining an Anonymous Block

An anonymous block in the SQL Developer workspace:

The screenshot shows the Oracle SQL Developer interface with the 'Worksheet' tab selected. The workspace contains the following PL/SQL code:

```
DECLARE
    v_fname VARCHAR2(20);
BEGIN
    SELECT first_name INTO v_fname FROM employees
    WHERE employee_id=100;
END;
/
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

To create an anonymous block by using SQL Developer, enter the block in the workspace (as shown in the slide).

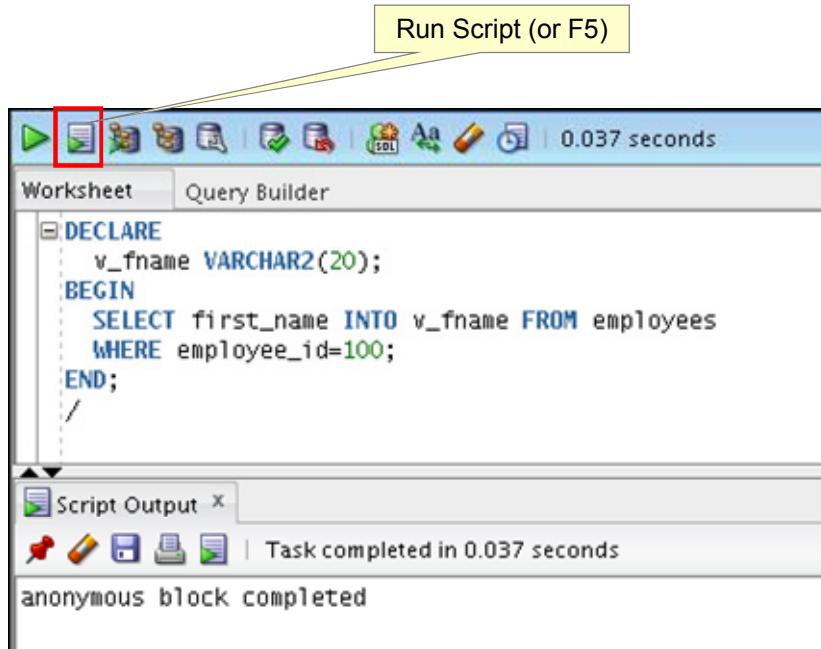

Example

The example block has the declarative section and the executable section. You need not pay attention to the syntax of statements in the block; you learn the syntax later in the course.

The anonymous block gets the `first_name` of the employee whose `employee_id` is 100, and stores it in a variable called `v_fname`.

Executing an Anonymous Block

Click the Run Script button to execute the anonymous block:

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

To execute an anonymous block, click the Run Script button (or press F5).

Note: The message “anonymous block completed” is displayed in the Script Output window after the block is executed.

Agenda

- Understanding the benefits and structure of PL/SQL
- Examining PL/SQL blocks
- Generating output messages in PL/SQL

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Enabling Output of a PL/SQL Block

1. To enable output in SQL Developer, execute the following command before running the PL/SQL block:

```
SET SERVEROUTPUT ON
```

2. Use a predefined Oracle package and its procedure in the anonymous block:

- DBMS_OUTPUT.PUT_LINE

```
DBMS_OUTPUT.PUT_LINE('The First Name of the  
Employee is ' || v_fname);  
...
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example shown in the previous slide, a value is stored in the `v_fname` variable. However, the value has not been printed.

PL/SQL does not have built-in input or output functionality. Therefore, you need to use predefined Oracle packages for input and output. To generate output, you must perform the following:

1. Execute the following command:

```
SET SERVEROUTPUT ON
```

Note: To enable output in SQL*Plus, you must explicitly issue the `SET SERVEROUTPUT ON` command.

2. In the PL/SQL block, use the `PUT_LINE` procedure of the `DBMS_OUTPUT` package to display the output. Pass the value that has to be printed as an argument to this procedure (as shown in the slide). The procedure then outputs the argument.

Viewing the Output of a PL/SQL Block

The screenshot shows the Oracle SQL Developer interface. In the top-left corner, there is a yellow callout box with the text: "Press F5 to execute the command and PL/SQL block." A yellow arrow points from this box to the "Run Script" icon in the toolbar. The main workspace displays the following PL/SQL code:

```
SET SERVEROUTPUT ON
DECLARE
    v_fname VARCHAR(20);
BEGIN
    SELECT first_name
    INTO v_fname
    FROM employees
    WHERE employee_id = 100;
    DBMS_OUTPUT.PUT_LINE('The First Name of the Employee is ' || v_fname);
END;
/
```

Below the code, the "Script Output" tab is selected, indicated by a red box around its title. The output pane shows the results of the execution:

```
anonymous block completed
The First Name of the Employee is Steven
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Press F5 (or click the Run Script icon) to view the output for the PL/SQL block. This action:

1. Executes the SET SERVEROUTPUT ON command
 2. Runs the anonymous PL/SQL block
- The output appears on the Script Output tab.

Quiz

A PL/SQL block *must* consist of the following three sections:

- A Declarative section, which begins with the keyword `DECLARE` and ends when the executable section starts
- An Executable section, which begins with the keyword `BEGIN` and ends with `END`
- An Exception handling section, which begins with the keyword `EXCEPTION` and is nested within the executable section
 - a. True
 - b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: b

A PL/SQL block consists of three sections:

- **Declarative (optional):** The optional declarative section begins with the keyword `DECLARE` and ends when the executable section starts.
- **Executable (required):** The required executable section begins with the keyword `BEGIN` and ends with `END`. This section essentially needs to have at least one statement. Observe that `END` is terminated with a semicolon. The executable section of a PL/SQL block can, in turn, include any number of PL/SQL blocks.
- **Exception handling (optional):** The optional exception section is nested within the executable section. This section begins with the keyword `EXCEPTION`.

Summary

In this lesson, you should have learned how to:

- Integrate SQL statements with PL/SQL program constructs
- Describe the benefits of PL/SQL
- Differentiate between PL/SQL block types
- Output messages in PL/SQL

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL is a language that has programming features that serve as extensions to SQL. SQL, which is a nonprocedural language, is made procedural with PL/SQL programming constructs. PL/SQL applications can run on any platform or operating system on which an Oracle Server runs. In this lesson, you learned how to build basic PL/SQL blocks.

Practice 2: Overview

This practice covers the following topics:

- Identifying the PL/SQL blocks that execute successfully
- Creating and executing a simple PL/SQL block

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This practice reinforces the basics of PL/SQL covered in this lesson.

- Exercise 1 is a paper-based exercise in which you identify PL/SQL blocks that execute successfully.
- Exercise 2 involves creating and executing a simple PL/SQL block.

3 Declaring PL/SQL Variables

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Recognize valid and invalid identifiers
- List the uses of variables
- Declare and initialize variables
- List and describe various data types
- Identify the benefits of using the %TYPE attribute
- Declare, use, and print bind variables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have already learned about basic PL/SQL blocks and their sections. In this lesson, you learn about valid and invalid identifiers. You learn how to declare and initialize variables in the declarative section of a PL/SQL block. The lesson describes the various data types. You also learn about the %TYPE attribute and its benefits.

Agenda

- Introducing variables
- Examining variable data types and the %TYPE attribute
- Examining bind variables

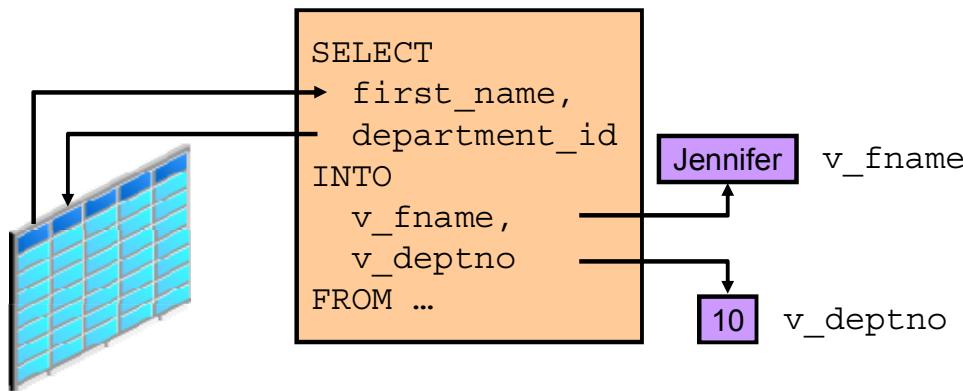

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use of Variables

Variables can be used for:

- Temporary storage of data
- Manipulation of stored values
- Reusability

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

With PL/SQL, you can declare variables, and then use them in SQL and procedural statements.

Variables are mainly used for storage of data and manipulation of stored values. Consider the PL/SQL statement in the slide. The statement retrieves `first_name` and `department_id` from the table. If you have to manipulate `first_name` or `department_id`, you have to store the retrieved value. Variables are used to temporarily store the value. You can use the value stored in these variables for processing and manipulating data. Variables can store any PL/SQL object such as variables, types, cursors, and subprograms.

Reusability is another advantage of declaring variables. After the variables are declared, you can use them repeatedly in an application by referring to them multiple times in various statements.

Requirements for Variable Names

A variable name:

- Must start with a letter
- Can include letters or numbers
- Can include special characters (such as \$, _, and #)
- Must contain no more than 30 characters
- Must not include reserved words

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The rules for naming a variable are listed in the slide.

Handling Variables in PL/SQL

Variables are:

- Declared and (optionally) initialized in the declarative section
- Used and assigned new values in the executable section
- Passed as parameters to PL/SQL subprograms
- Used to hold the output of a PL/SQL subprogram

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use variables in the following ways:

- **Declare and initialize them in the declaration section:** You can declare variables in the declarative part of any PL/SQL block, subprogram, or package. Declarations allocate storage space for a value, specify its data type, and name the storage location so that you can reference it. Declarations can also assign an initial value and impose the NOT NULL constraint on the variable. Forward references are not allowed. You must declare a variable before referencing it in other statements, including other declarative statements.
- **Use them and assign new values to them in the executable section:** In the executable section, the existing value of the variable can be replaced with a new value.
- **Pass them as parameters to PL/SQL subprograms:** Subprograms can take parameters. You can pass variables as parameters to subprograms.
- **Use them to hold the output of a PL/SQL subprogram:** Variables can be used to hold the value that is returned by a function.

Declaring and Initializing PL/SQL Variables

Syntax:

```
identifier [CONSTANT] datatype [NOT NULL]  
[ := | DEFAULT expr];
```

Examples:

```
DECLARE  
    v_hiredate      DATE;  
    v_location      VARCHAR2(13) := 'Atlanta';  
    v_deptno        NUMBER(2) NOT NULL := 10;  
    c_comm          CONSTANT NUMBER := 1400;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You must declare all PL/SQL identifiers in the declaration section before referencing them in the PL/SQL block. You have the option of assigning an initial value to a variable (as shown in the slide). You do not need to assign a value to a variable in order to declare it. If you refer to other variables in a declaration, be sure that they are already declared separately in a previous statement.

In the syntax:

<i>identifier</i>	Is the name of the variable
<i>data type</i>	Is a scalar, composite, reference, or LOB data type (This course covers only scalar, composite, and LOB data types.)
CONSTANT	Constrains the variable so that its value cannot change (Constants must be initialized.)
NOT NULL	Constrains the variable so that it contains a value (NOT NULL variables must be initialized.)
<i>expr</i>	Is any PL/SQL expression that can be a literal expression, another variable, or an expression involving operators and functions

Note: In addition to variables, you can also declare cursors and exceptions in the declarative section. You learn about declaring cursors in the lesson titled “Using Explicit Cursors” and about exceptions in the lesson titled “Handling Exceptions.”

Declaring and Initializing PL/SQL Variables

1

```
DECLARE
    v_myName  VARCHAR(20);
BEGIN
    DBMS_OUTPUT.PUT_LINE('My name is: ' || v_myName );
    v_myName := 'John';
    DBMS_OUTPUT.PUT_LINE('My name is: ' || v_myName );
END;
/
```

2

```
DECLARE
    v_myName VARCHAR2(20) := 'John';
BEGIN
    v_myName := 'Steven';
    DBMS_OUTPUT.PUT_LINE('My name is: ' || v_myName );
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Examine the two code blocks in the slide.

1. In the first block, the `v_myName` variable is declared but not initialized. A value `John` is assigned to the variable in the executable section.
 - String literals must be enclosed in single quotation marks. If your string has a quotation mark as in "Today's Date," the string would be '`'Today'`'s Date'.
 - The assignment operator is: "`:=`".
 - The `PUT_LINE` procedure is invoked by passing the `v_myName` variable. The value of the variable is concatenated with the string '`My name is:`'.
 - Output of this anonymous block is:

```
anonymous block completed
My name is:
My name is: John
```

2. In the second block, the `v_myName` variable is declared and initialized in the declarative section. `v_myName` holds the value `John` after initialization. This value is manipulated in the executable section of the block. The output of this anonymous block is:

```
anonymous block completed
My name is: Steven
```

Delimiters in String Literals

```
DECLARE
    v_event VARCHAR2(15);
BEGIN
    v_event := q'!Father's day!';
    DBMS_OUTPUT.PUT_LINE('3rd Sunday in June is :
    '|| v_event );
    v_event := q'[Mother's day]';
    DBMS_OUTPUT.PUT_LINE('2nd Sunday in May is :
    '|| v_event );
END;
/
```

Resulting output

anonymous block completed
3rd Sunday in June is : Father's day
2nd Sunday in May is : Mother's day

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

If your string contains an apostrophe (identical to a single quotation mark), you must double the quotation mark, as in the following example:

```
v_event  VARCHAR2(15) :='Father''s day';
```

The first quotation mark acts as the escape character. This makes your string complicated, especially if you have SQL statements as string, the slide shows how to use the q' notation to specify the delimiters. You can specify any character that is not present in the string as a delimiter. The example uses ! and [as delimiters. Consider the following example:

```
v_event  := q'!Father's day!';
```

You can compare this with the first example on this page. You start the string with q' if you want to use a delimiter. The character following the notation is the delimiter used. Enter your string after specifying the delimiter, close the delimiter, and close the notation with a single quotation mark. The following example shows how to use [as a delimiter:

```
v_event  := q'[Mother's day] ';
```

Agenda

- Introducing variables
- Examining variable data types and the %TYPE attribute
- Examining bind variables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Types of Variables

- PL/SQL variables:
 - Scalar
 - Reference
 - Large object (LOB)
 - Composite
- Non-PL/SQL variables: Bind variables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Every PL/SQL variable has a data type, which specifies a storage format, constraints, and a valid range of values. PL/SQL supports several data type categories, including scalar, reference, large object (LOB), and composite.

- **Scalar data types:** Scalar data types hold a single value. The value depends on the data type of the variable. For example, the `v_myName` variable in the example in the section “Declaring and Initializing PL/SQL Variables” (in this lesson) is of type `VARCHAR2`. Therefore, `v_myName` can hold a string value. PL/SQL also supports Boolean variables.
- **Reference data types:** Reference data types hold values, called *pointers*, which point to a storage location.
- **LOB data types:** LOB data types hold values, called *locators*, which specify the location of large objects (such as graphic images) that are stored outside the table.
- **Composite data types:** Composite data types are available by using PL/SQL *collection* and *record* variables. PL/SQL collections and records contain internal elements that you can treat as individual variables.

Non-PL/SQL variables include host language variables declared in precompiler programs, screen fields in Forms applications, and host variables. You learn about host variables later in this lesson.

For more information about LOBS, see the *PL/SQL User’s Guide and Reference*.

Types of Variables

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide illustrates the following data types:

- TRUE represents a Boolean value.
- 15-JAN-09 represents a DATE.
- The image represents a BLOB.
- The text in the callout can represent a VARCHAR2 data type or a CLOB.
- 256120.08 represents a NUMBER data type with precision and scale.
- The film reel represents a BFILE.
- The city name *Atlanta* represents a VARCHAR2 data type.

Guidelines for Declaring and Initializing PL/SQL Variables

- Follow consistent naming conventions.
- Use meaningful identifiers for variables.
- Initialize variables that are designated as NOT NULL and CONSTANT.
- Initialize variables with the assignment operator (:=) or the DEFAULT keyword:

```
v_myName VARCHAR2(20) := 'John' ;
```

```
v_myName VARCHAR2(20) DEFAULT 'John' ;
```

- Declare one identifier per line for better readability and code maintenance.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Here are some guidelines to follow when you declare PL/SQL variables.

- Follow consistent naming conventions—for example, you might use `name` to represent a variable and `c_name` to represent a constant. Similarly, to name a variable, you can use `v_fname`. The key is to apply your naming convention consistently for easier identification.
- Use meaningful and appropriate identifiers for variables. For example, consider using `salary` and `sal_with_commission` instead of `salary1` and `salary2`.
- If you use the NOT NULL constraint, you must assign a value when you declare the variable.
- In constant declarations, the CONSTANT keyword must precede the type specifier. The following declaration names a constant of NUMBER type and assigns the value of 50,000 to the constant. A constant must be initialized in its declaration; otherwise, you get a compilation error. After initializing a constant, you cannot change its value.

```
sal CONSTANT NUMBER := 50000.00;
```

Guidelines for Declaring PL/SQL Variables

- Avoid using column names as identifiers.

```
DECLARE
    employee_id  NUMBER (6);
BEGIN
    SELECT      employee_id
    INTO        employee_id
    FROM        employees
    WHERE       last_name = 'Kochhar';
END;
/
```

A yellow triangular warning sign with a red exclamation mark in the center. It is positioned to the right of the PL/SQL code, specifically pointing towards the two occurrences of 'employee_id' in the SELECT statement.

- Use the NOT NULL constraint when the variable must hold a value.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- Initialize the variable to an expression with the assignment operator (:=) or with the DEFAULT reserved word. If you do not assign an initial value, the new variable contains NULL by default until you assign a value. To assign or reassign a value to a variable, you write a PL/SQL assignment statement. However, it is good programming practice to initialize all variables.
- Two objects can have the same name only if they are defined in different blocks. Where they coexist, you can qualify them with labels and use them.
- Avoid using column names as identifiers. If PL/SQL variables occur in SQL statements and have the same name as a column, the Oracle Server assumes that it is the column that is being referenced. Although the code example in the slide works, code that is written using the same name for a database table and a variable is not easy to read or maintain.
- Impose the NOT NULL constraint when the variable must contain a value. You cannot assign nulls to a variable that is defined as NOT NULL. The NOT NULL constraint must be followed by an initialization clause.

```
pincode VARCHAR2(15) NOT NULL := 'Oxford';
```

Naming Conventions of PL/SQL Structures Used in This Course

PL/SQL Structure	Convention	Example
Variable	v_variable_name	v_rate
Constant	c_constant_name	c_rate
Subprogram parameter	p_parameter_name	p_id
Bind (host) variable	b_bind_name	b_salary
Cursor	cur_cursor_name	cur_emp
Record	rec_record_name	rec_emp
Type	type_name_type	ename_table_type
Exception	e_exception_name	e_products_invalid
File handle	f_file_handle_name	f_file

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The table in the slide displays some examples of the naming conventions for PL/SQL structures that are used in this course.

Scalar Data Types

- Hold a single value
- Have no internal components

TRUE

15-JAN-09

256120.08

Atlanta

The soul of the lazy man
desires, and he has nothing;
but the soul of the diligent
shall be made rich.

**ORACLE**

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL provides a variety of predefined data types. For instance, you can choose from integer, floating point, character, Boolean, date, collection, and LOB types. This lesson covers the basic types that are used frequently in PL/SQL programs.

A scalar data type holds a single value and has no internal components. Scalar data types can be classified into four categories: number, character, date, and Boolean. Character and number data types have subtypes that associate a base type to a constraint. For example, `INTEGER` and `POSITIVE` are subtypes of the `NUMBER` base type.

For more information about scalar data types (as well as the complete list), see the *PL/SQL User's Guide and Reference*.

Base Scalar Data Types

- CHAR [(maximum_length)]
- VARCHAR2 (maximum_length)
- NUMBER [(precision, scale)]
- BINARY_INTEGER
- PLS_INTEGER
- BOOLEAN
- BINARY_FLOAT
- BINARY_DOUBLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Data Type	Description
CHAR [(<i>maximum_length</i>)]	Base type for fixed-length character data up to 32,767 bytes. If you do not specify a maximum length, the default length is set to 1 byte.
VARCHAR2 (<i>maximum_length</i>)	Base type for variable-length character data up to 32,767 bytes. There is no default size for VARCHAR2 variables and constants.
NUMBER [(<i>precision, scale</i>)]	Number having precision <i>p</i> and scale <i>s</i> . The precision <i>p</i> can range from 1 through 38. The scale <i>s</i> can range from –84 through 127.
BINARY_INTEGER	Base type for integers between –2,147,483,647 and 2,147,483,647

Data Type	Description
PLS_INTEGER	Base type for signed integers between -2,147,483,648 and 2,147,483,647. PLS_INTEGER values require less storage and are faster than NUMBER values. In Oracle Database 11g and Oracle Database 12c, the PLS_INTEGER and BINARY_INTEGER data types are identical. The arithmetic operations on PLS_INTEGER and BINARY_INTEGER values are faster than on NUMBER values.
BOOLEAN	Base type that stores one of the three possible values used for logical calculations: TRUE, FALSE, and NULL
BINARY_FLOAT	Represents floating-point number in IEEE 754 format. It requires 5 bytes to store the value.
BINARY_DOUBLE	Represents floating-point number in IEEE 754 format. It requires 9 bytes to store the value.

Base Scalar Data Types

- DATE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Data Type	Description
DATE	Base type for dates and times. DATE values include the time of day in seconds since midnight. The range for dates is between 4712 B.C. and A.D. 9999.
TIMESTAMP	The TIMESTAMP data type, which extends the DATE data type, stores the year, month, day, hour, minute, second, and fraction of second. The syntax is TIMESTAMP[(precision)], where the optional parameter precision specifies the number of digits in the fractional part of the seconds field. To specify the precision, you must use an integer in the range 0–9. The default is 6.
TIMESTAMP WITH TIME ZONE	The TIMESTAMP WITH TIME ZONE data type, which extends the TIMESTAMP data type, includes a time-zone displacement. The time-zone displacement is the difference (in hours and minutes) between local time and Coordinated Universal Time (UTC), formerly known as Greenwich Mean Time. The syntax is TIMESTAMP[(precision)] WITH TIME ZONE, where the optional parameter precision specifies the number of digits in the fractional part of the seconds field. To specify the precision, you must use an integer in the range 0–9. The default is 6.

Data Type	Description
TIMESTAMP WITH LOCAL TIME ZONE	<p>The TIMESTAMP WITH LOCAL TIME ZONE data type, which extends the TIMESTAMP data type, includes a time-zone displacement. The time-zone displacement is the difference (in hours and minutes) between local time and Coordinated Universal Time (UTC), formerly known as Greenwich Mean Time. The syntax is <code>TIMESTAMP[(precision)] WITH LOCAL TIME ZONE</code>, where the optional parameter precision specifies the number of digits in the fractional part of the seconds field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0–9. The default is 6.</p> <p>This data type differs from <code>TIMESTAMP WITH TIME ZONE</code> in that when you insert a value into a database column, the value is normalized to the database time zone, and the time-zone displacement is not stored in the column. When you retrieve the value, the Oracle server returns the value in your local session time zone.</p>
INTERVAL YEAR TO MONTH	<p>You use the INTERVAL YEAR TO MONTH data type to store and manipulate intervals of years and months. The syntax is <code>INTERVAL YEAR[(precision)] TO MONTH</code>, where precision specifies the number of digits in the years field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0–4. The default is 2.</p>
INTERVAL DAY TO SECOND	<p>You use the INTERVAL DAY TO SECOND data type to store and manipulate intervals of days, hours, minutes, and seconds. The syntax is <code>INTERVAL DAY[(precision1)] TO SECOND[(precision2)]</code>, where precision1 and precision2 specify the number of digits in the days field and seconds field, respectively. In both cases, you cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0–9. The defaults are 2 and 6, respectively.</p>

Declaring Scalar Variables

Examples:

```
DECLARE
    v_emp_job          VARCHAR2(9);
    v_count_loop       BINARY_INTEGER := 0;
    v_dept_total_sal  NUMBER(9,2)  := 0;
    v_orderdate        DATE := SYSDATE + 7;
    c_tax_rate         CONSTANT NUMBER(3,2) := 8.25;
    v_valid            BOOLEAN NOT NULL := TRUE;
    ...
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The examples of variable declaration shown in the slide are defined as follows:

- `v_emp_job`: Variable to store an employee job title
- `v_count_loop`: Variable to count the iterations of a loop; initialized to 0
- `v_dept_total_sal`: Variable to accumulate the total salary for a department; initialized to 0
- `v_orderdate`: Variable to store the ship date of an order; initialized to one week from today
- `c_tax_rate`: Constant variable for the tax rate (which never changes throughout the PL/SQL block); set to 8.25
- `v_valid`: Flag to indicate whether a piece of data is valid or invalid; initialized to TRUE

%TYPE Attribute

- Is used to declare a variable according to:
 - A database column definition
 - Another declared variable
- Is prefixed with:
 - The database table and column name
 - The name of the declared variable

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL variables are usually declared to hold and manipulate data stored in a database. When you declare PL/SQL variables to hold column values, you must ensure that the variable is of the correct data type and precision. If it is not, a PL/SQL error occurs during execution. If you have to design large subprograms, this can be time-consuming and error-prone.

Rather than hard-coding the data type and precision of a variable, you can use the %TYPE attribute to declare a variable according to another previously declared variable or database column. The %TYPE attribute is most often used when the value stored in the variable is derived from a table in the database. When you use the %TYPE attribute to declare a variable, you should prefix it with the database table and column name. If you refer to a previously-declared variable, prefix the variable name of the previously-declared variable to the variable being declared.

Advantages of the %TYPE Attribute

- You can avoid errors caused by data type mismatch or wrong precision.
- You can avoid hard coding the data type of a variable.
- You need not change the variable declaration if the column definition changes. If you have already declared some variables for a particular table without using the %TYPE attribute, the PL/SQL block may throw errors if the column for which the variable is declared is altered. When you use the %TYPE attribute, PL/SQL determines the data type and size of the variable when the block is compiled. This ensures that such a variable is always compatible with the column that is used to populate it.

Declaring Variables with the %TYPE Attribute

Syntax

```
identifier      table.column_name%TYPE;
```

Examples

```
...
  v_emp_lname      employees.last_name%TYPE;
...
```

```
...
  v_balance        NUMBER(7,2);
  v_min_balance   v_balance%TYPE := 1000;
...
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Declare variables to store the last name of an employee. The `v_emp_lname` variable is defined to be of the same data type as the `last_name` column in the `employees` table. The `%TYPE` attribute provides the data type of a database column.

Declare variables to store the balance of a bank account, as well as the minimum balance, which is 1,000. The `v_min_balance` variable is defined to be of the same data type as the `v_balance` variable. The `%TYPE` attribute provides the data type of a variable.

A NOT NULL database column constraint does not apply to variables that are declared using `%TYPE`. Therefore, if you declare a variable using the `%TYPE` attribute that uses a database column defined as NOT NULL, you can assign the NULL value to the variable.

Declaring Boolean Variables

- Only the TRUE, FALSE, and NULL values can be assigned to a Boolean variable.
- Conditional expressions use the logical operators AND and OR, and the unary operator NOT to check the variable values.
- The variables always yield TRUE, FALSE, or NULL.
- Arithmetic, character, and date expressions can be used to return a Boolean value.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

With PL/SQL, you can compare variables in both SQL and procedural statements. These comparisons, called Boolean expressions, consist of simple or complex expressions separated by relational operators. In a SQL statement, you can use Boolean expressions to specify the rows in a table that are affected by the statement. In a procedural statement, Boolean expressions are the basis for conditional control. NULL stands for a missing, inapplicable, or unknown value.

Examples

```
emp_sal1 := 50000;  
emp_sal2 := 60000;
```

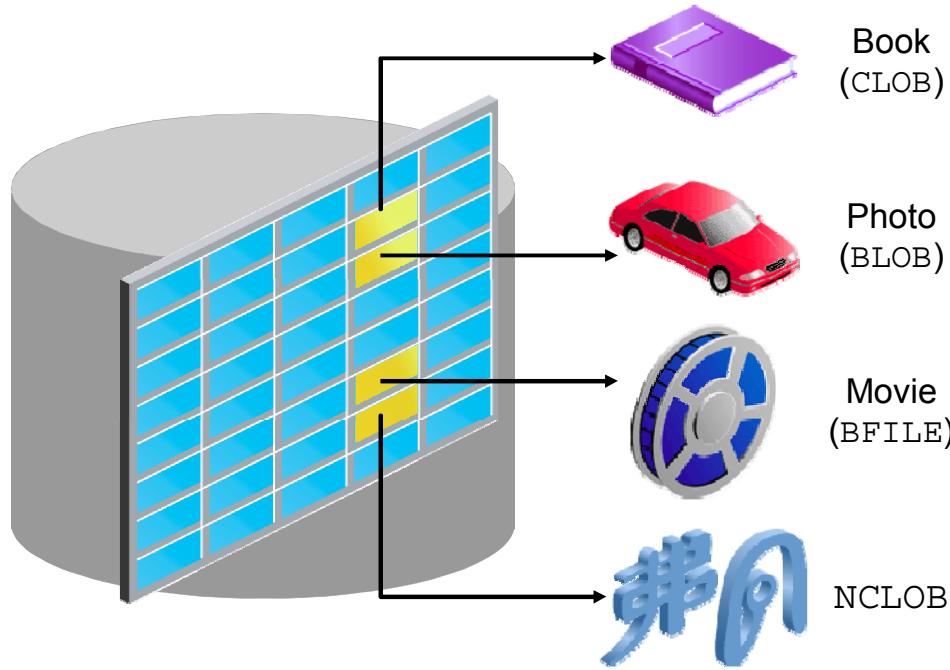

The following expression yields TRUE:

```
emp_sal1 < emp_sal2
```

Declare and initialize a Boolean variable:

```
DECLARE  
    flag BOOLEAN := FALSE;  
BEGIN  
    flag := TRUE;  
END;  
/
```

LOB Data Type Variables

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Large objects (LOBs) are meant to store a large amount of data. A database column can be of the LOB category. With the LOB category of data types (BLOB, CLOB, and so on), you can store blocks of unstructured data (such as text, graphic images, video clips, and sound wave forms) of up to 128 terabytes depending on the database block size. LOB data types allow efficient, random, piecewise access to data and can be attributes of an object type.

- The character large object (CLOB) data type is used to store large blocks of character data in the database.
- The binary large object (BLOB) data type is used to store large unstructured or structured binary objects in the database. When you insert or retrieve such data into or from the database, the database does not interpret the data. External applications that use this data must interpret the data.
- The binary file (BFILE) data type is used to store large binary files. Unlike other LOBs, BFILES are stored outside the database and not in the database. They could be operating system files. Only a pointer to the BFILE is stored in the database.
- The national language character large object (NCLOB) data type is used to store large blocks of single-byte or fixed-width multibyte NCHAR unicode data in the database.

Composite Data Types: Records and Collections

PL/SQL Record:

TRUE	23-DEC-98	ATLANTA	
------	-----------	---------	---

PL/SQL Collections:

1	SMITH	1	5000
2	JONES	2	2345
3	NANCY	3	12
4	TIM	4	3456

↑ ↑ ↑ ↑

PLS_INTEGER VARCHAR2 PLS_INTEGER NUMBER

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As mentioned previously, a scalar data type holds a single value and has no internal components. Composite data types—called PL/SQL Records and PL/SQL Collections—have internal components that you can treat as individual variables.

- In a PL/SQL record, the internal components can be of different data types, and are called fields. You access each field with this syntax: `record_name.field_name`. A record variable can hold a table row, or some columns from a table row. Each record field corresponds to a table column.
- In a PL/SQL collection, the internal components are always of the same data type, and are called elements. You access each element by its unique subscript. Lists and arrays are classic examples of collections. There are three types of PL/SQL collections: Associative Arrays, Nested Tables, and VARRAY types.

Note

- PL/SQL Records and Associative Arrays are covered in the lesson titled: “Working with Composite Data Types.”
- NESTED TABLE and VARRAY data types are covered in the course titled *Advanced PL/SQL*.

Agenda

- Introducing variables
- Examining variable data types and the %TYPE attribute
- Examining bind variables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Bind Variables

Bind variables are:

- Created in the environment
- Also called *host* variables
- Created with the VARIABLE keyword*
- Used in SQL statements and PL/SQL blocks
- Accessed even after the PL/SQL block is executed
- Referenced with a preceding colon

Values can be output using the PRINT command.

* Required when using SQL*Plus and SQL Developer

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Bind variables are variables that you create in a host environment. For this reason, they are sometimes called *host* variables.

Uses of Bind Variables

Bind variables are created in the environment and not in the declarative section of a PL/SQL block. Therefore, bind variables are accessible even after the block is executed. When created, bind variables can be used and manipulated by multiple subprograms. They can be used in SQL statements and PL/SQL blocks just like any other variable. These variables can be passed as run-time values into or out of PL/SQL subprograms.

Note: A bind variable is an environment variable, but is not a global variable.

Creating Bind Variables

To create a bind variable in SQL Developer, use the VARIABLE command. For example, you declare a variable of type NUMBER and VARCHAR2 as follows:

```
VARIABLE return_code NUMBER  
VARIABLE return_msg  VARCHAR2(30)
```

Viewing Values in Bind Variables

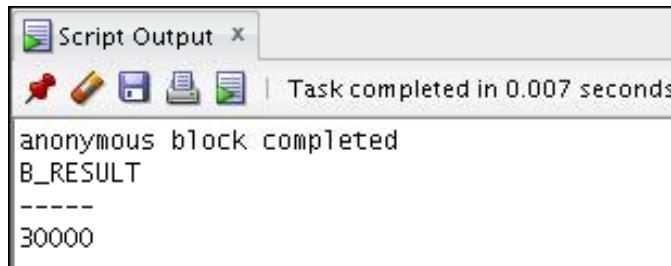

You can reference the bind variable using SQL Developer and view its value using the PRINT command.

Example

You can reference a bind variable in a PL/SQL program by preceding the variable with a colon.

For example, the following PL/SQL block creates and uses the bind variable `b_result`. The output resulting from the `PRINT` command is shown below the code.

```
VARIABLE b_result NUMBER
BEGIN
    SELECT (SALARY*12) + NVL(COMMISSION_PCT, 0) INTO :b_result
    FROM employees WHERE employee_id = 144;
END;
/
PRINT b_result
```

The screenshot shows the 'Script Output' window from Oracle SQL Developer. The title bar says 'Script Output x'. Below it is a toolbar with icons for Run, Stop, Save, and Print. A status message 'Task completed in 0.007 seconds' is displayed. The main pane contains the following text:
anonymous block completed
B_RESULT

30000

Note: If you are creating a bind variable of the `NUMBER` type, you cannot specify the precision and scale. However, you can specify the size for character strings. An Oracle `NUMBER` is stored in the same way regardless of the dimension. The Oracle Server uses the same number of bytes to store 7, 70, and .0734. It is not practical to calculate the size of the Oracle number representation from the number format, so the code always allocates the bytes needed. With character strings, the user has to specify the size so that the required number of bytes can be allocated.

Referencing Bind Variables

Example:

```
VARIABLE b_emp_salary NUMBER
BEGIN
    SELECT salary INTO :b_emp_salary
    FROM employees WHERE employee_id = 178;
END;
/
PRINT b_emp_salary
SELECT first_name, last_name
FROM employees
WHERE salary=:b_emp_salary;
```

Output →

FIRST_NAME	LAST_NAME
Oliver	Tuvault
Sarath	Sewall
Kimberely	Grant

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As stated previously, after you create a bind variable, you can reference that variable in any other SQL statement or PL/SQL program.

In the example, `b_emp_salary` is created as a bind variable in the PL/SQL block. Then, it is used in the `SELECT` statement that follows.

When you execute the PL/SQL block shown in the slide, you see the following output:

- The `PRINT` command executes:

```
b_emp_salary
-----
7000
```

- Then, the output of the SQL statement follows:

FIRST_NAME	LAST_NAME
Oliver	Tuvault
Sarath	Sewall
Kimberely	Grant

Note: To display all bind variables, use the `PRINT` command without a variable.

Using AUTOPRINT with Bind Variables

The screenshot shows the Oracle SQL Developer interface. On the left, a worksheet window displays a PL/SQL block:

```

VARIABLE b_emp_salary NUMBER
SET AUTOPRINT ON
DECLARE
    v_empno NUMBER(6):=&empno;
BEGIN
    SELECT salary INTO :b_emp_salary
    FROM employees WHERE employee_id = v_empno;
END;
/

```

A red box highlights the `SET AUTOPRINT ON` statement. A red arrow points from this box to a modal dialog titled "Enter Substitution Variable". The dialog has a single input field labeled "EMPNO:" containing the value "178". Another red arrow points from this dialog to the "Script Output" window on the right.

The "Script Output" window shows the executed code and its output:

```

old:DECLARE
v_empno NUMBER(6):=&empno;
BEGIN
    SELECT salary INTO :b_emp_salary
    FROM employees WHERE employee_id = v_empno;
END;
new:DECLARE
v_empno NUMBER(6):=178;
BEGIN
    SELECT salary INTO :b_emp_salary
    FROM employees WHERE employee_id = v_empno;
END;
anonymous block completed
b_emp_salary
-----
7000

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use the `SET AUTOPRINT ON` command to automatically display the bind variables used in a successful PL/SQL block.

Example

In the code example:

- A bind variable named `b_emp_salary` is created and `AUTOPRINT` is turned on.
- A variable named `v_empno` is declared, and a substitution variable is used to receive user input.
- Finally, the bind variable and temporary variables are used in the executable section of the PL/SQL block.

When a valid employee number is entered—in this case 178—the output of the bind variable is automatically printed. The bind variable contains the salary for the employee number that is provided by the user.

Quiz

The %TYPE attribute:

- a. Is used to declare a variable according to a database column definition
- b. Is used to declare a variable according to a collection of columns in a database table or view
- c. Is used to declare a variable according to the definition of another declared variable
- d. Is prefixed with the database table and column name or the name of the declared variable

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a, c, d

The %TYPE Attribute

PL/SQL variables are usually declared to hold and manipulate data stored in a database. When you declare PL/SQL variables to hold column values, you must ensure that the variable is of the correct data type and precision. If it is not, a PL/SQL error occurs during execution. If you have to design large subprograms, this can be time-consuming and error-prone.

Rather than hard-coding the data type and precision of a variable, you can use the %TYPE attribute to declare a variable according to another previously declared variable or database column. The %TYPE attribute is most often used when the value stored in the variable is derived from a table in the database. When you use the %TYPE attribute to declare a variable, you should prefix it with the database table and column name. If you refer to a previously declared variable, prefix the variable name of the previously-declared variable to the variable being declared. The benefit of %TYPE is that you do not have to change the variable if the column is altered. Also, if the variable is used in any calculations, you need not worry about its precision.

The %ROWTYPE Attribute

The %ROWTYPE attribute is used to declare a record that can hold an entire row of a table or view. You learn about this attribute in the lesson titled “Working with Composite Data Types.”

Summary

In this lesson, you should have learned how to:

- Recognize valid and invalid identifiers
- Declare variables in the declarative section of a PL/SQL block
- Initialize variables and use them in the executable section
- Differentiate between scalar and composite data types
- Use the %TYPE attribute
- Use bind variables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An anonymous PL/SQL block is a basic, unnamed unit of a PL/SQL program. It consists of a set of SQL or PL/SQL statements to perform a logical function. The declarative part is the first part of a PL/SQL block and is used for declaring objects such as variables, constants, cursors, and definitions of error situations called *exceptions*.

In this lesson, you learned how to declare variables in the declarative section. You saw some of the guidelines for declaring variables. You learned how to initialize variables when you declare them.

The executable part of a PL/SQL block is the mandatory part and contains SQL and PL/SQL statements for querying and manipulating data. You learned how to initialize variables in the executable section and also how to use them and manipulate the values of variables.

Practice 3: Overview

This practice covers the following topics:

- Determining valid identifiers
- Determining valid variable declarations
- Declaring variables within an anonymous block
- Using the %TYPE attribute to declare variables
- Declaring and printing a bind variable
- Executing a PL/SQL block

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Writing Executable Statements

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Identify lexical units in a PL/SQL block
- Use built-in SQL functions in PL/SQL
- Describe when implicit conversions take place and when explicit conversions have to be dealt with
- Write nested blocks and qualify variables with labels
- Write readable code with appropriate indentation
- Use sequences in PL/SQL expressions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned how to declare variables and write executable statements in a PL/SQL block. In this lesson, you learn how lexical units make up a PL/SQL block. You learn to write nested blocks. You also learn about the scope and visibility of variables in nested blocks and about qualifying variables with labels.

Agenda

- Writing executable statements in a PL/SQL block
- Writing nested blocks
- Using operators and developing readable code

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Lexical Units in a PL/SQL Block

Lexical units:

- Are building blocks of any PL/SQL block
- Are sequences of characters including letters, numerals, tabs, spaces, returns, and symbols
- Can be classified as:
 - Identifiers: v_fname, c_percent
 - Delimiters: ; , +, -
 - Literals: John, 428, True
 - Comments: --, /* */

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Lexical units include letters, numerals, special characters, tabs, spaces, returns, and symbols.

- **Identifiers:** Identifiers are the names given to PL/SQL objects. You learned to identify valid and invalid identifiers. Recall that keywords cannot be used as identifiers.

Quoted identifiers:

- Make identifiers case-sensitive
- Include characters such as spaces
- Use reserved words

Examples:

```
"begin date" DATE;  
"end date"    DATE;  
"exception thrown" BOOLEAN DEFAULT TRUE;
```

All subsequent usage of these variables should have double quotation marks. However, use of quoted identifiers is not recommended.

- **Delimiters:** Delimiters are symbols that have special meaning. You already learned that the semicolon (;) is used to terminate a SQL or PL/SQL statement. Therefore, ; is an example of a delimiter.

For more information, refer to the *PL/SQL User's Guide and Reference*.

Delimiters are simple or compound symbols that have special meaning in PL/SQL.

Simple symbols

Symbol	Meaning
+	Addition operator
-	Subtraction/negation operator
*	Multiplication operator
/	Division operator
=	Equality operator
@	Remote access indicator
;	Statement terminator

Compound symbols

Symbol	Meaning
<>	Inequality operator
!=	Inequality operator
	Concatenation operator
--	Single-line comment indicator
/*	Beginning comment delimiter
*/	Ending comment delimiter
:=	Assignment operator

Note: This is only a subset and not a complete list of delimiters.

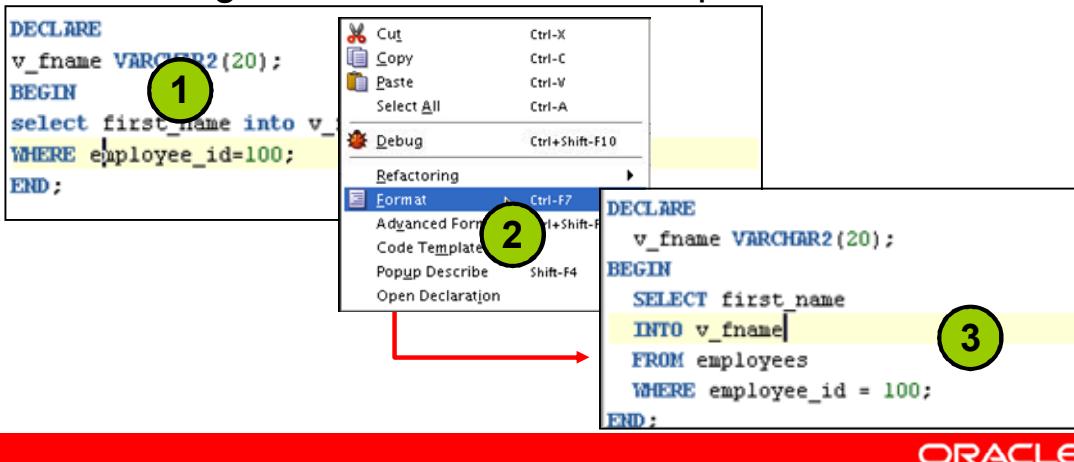

- **Literals:** Any value that is assigned to a variable is a literal. Any character, numeral, Boolean, or date value that is not an identifier is a literal. Literals are classified as:
 - **Character literals:** All string literals have the data type CHAR or VARCHAR2 and are, therefore, called character literals (for example, John, and 12c).
 - **Numeric literals:** A numeric literal represents an integer or real value (for example, 428 and 1.276).
 - **Boolean literals:** Values that are assigned to Boolean variables are Boolean literals. TRUE, FALSE, and NULL are Boolean literals or keywords.
- **Comments:** It is good programming practice to explain what a piece of code is trying to achieve. However, when you include the explanation in a PL/SQL block, the compiler cannot interpret these instructions. Therefore, there should be a way in which you can indicate that these instructions need not be compiled. Comments are mainly used for this purpose. Any instruction that is commented is not interpreted by the compiler.
 - Two hyphens (--) are used to comment a single line.
 - The beginning and ending comment delimiters /* and */ are used to comment multiple lines.

PL/SQL Block Syntax and Guidelines

- Using Literals
 - Character and date literals must be enclosed in single quotation marks.
 - Numbers can be simple values or in scientific notation.

```
v_name := 'Henderson';
```

- Formatting Code: Statements can span several lines.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Using Literals

A literal is an explicit numeric, character string, date, or Boolean value that is not represented by an identifier.

- Character literals include all printable characters in the PL/SQL character set: letters, numerals, spaces, and special symbols.
- Numeric literals can be represented either by a simple value (for example, `-32.5`) or in scientific notation (for example, `2E5` means $2 * 10^5 = 200,000$).

Formatting Code

In a PL/SQL block, a SQL statement can span several lines (as shown in example 3 in the slide).

You can format an unformatted SQL statement (as shown in example 1 in the slide) by using the SQL Worksheet shortcut menu. Right-click the active SQL Worksheet and, in the shortcut menu that appears, select the Format option (as shown in example 2).

Note: You can also use the shortcut key combination of `Ctrl + F7` to format your code.

Commenting Code

- Prefix single-line comments with two hyphens (--).
- Place a block comment between the symbols /* and */.

Example:

```
DECLARE
  ...
  v_annual_sal NUMBER (9,2);
BEGIN
  /* Compute the annual salary based on the
     monthly salary input from the user */
  v_annual_sal := monthly_sal * 12;
  --The following line displays the annual salary
  DBMS_OUTPUT.PUT_LINE(v_annual_sal);
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You should comment code to document each phase and to assist debugging. In PL/SQL code:

- A single-line comment is commonly prefixed with two hyphens (--)
- You can also enclose a comment between the symbols /* and */

Note: For multiline comments, you can either precede each comment line with two hyphens, or use the block comment format.

Comments are strictly informational and do not enforce any conditions or behavior on the logic or data. Well-placed comments are extremely valuable for code readability and future code maintenance.

SQL Functions in PL/SQL

- Available in procedural statements:
 - Single-row functions
- Not available in procedural statements:
 - DECODE
 - Group functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL provides several predefined functions that can be used in SQL statements. Most of these functions (such as single-row number and character functions, data type conversion functions, and date and time-stamp functions) are valid in PL/SQL expressions.

The following functions are not available in procedural statements:

- DECODE
 - Group functions: AVG, MIN, MAX, COUNT, SUM, STDDEV, and VARIANCE
- Group functions apply to groups of rows in a table and are, therefore, available only in SQL statements in a PL/SQL block. The functions mentioned here are only a subset of the complete list.

SQL Functions in PL/SQL: Examples

- Get the length of a string:

```
v_desc_size INTEGER(5);  
v_prod_description VARCHAR2(70) := 'You can use this  
product with your radios for higher frequency';  
  
-- get the length of the string in prod_description  
v_desc_size:= LENGTH(v_prod_description);
```

- Get the number of months an employee has worked:

```
v_tenure:= MONTHS_BETWEEN (CURRENT_DATE, v_hiredate);
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use SQL functions to manipulate data. These functions are grouped into the following categories:

- Number
- Character
- Conversion
- Date
- Miscellaneous

Using Sequences in PL/SQL Expressions

Starting in 11g:

```
DECLARE
    v_new_id NUMBER;
BEGIN
    v_new_id := my_seq.NEXTVAL;
END;
/
```

Before 11g:

```
DECLARE
    v_new_id NUMBER;
BEGIN
    SELECT my_seq.NEXTVAL INTO v_new_id FROM Dual;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In Oracle Database 11g and later, you can use the `NEXTVAL` and `CURRVAL` pseudocolumns in any PL/SQL context, where an expression of the `NUMBER` data type may legally appear. Although the old style of using a `SELECT` statement to query a sequence is still valid, it is recommended that you do not use it.

Before Oracle Database 11g, you were forced to write a SQL statement in order to use a sequence object value in a PL/SQL subroutine. Typically, you would write a `SELECT` statement to reference the pseudocolumns of `NEXTVAL` and `CURRVAL` to obtain a sequence number. This method created a usability problem.

In Oracle Database 11g and later, the limitation of forcing you to write a SQL statement to retrieve a sequence value is eliminated. With the sequence enhancement feature:

- Sequence usability is improved
- The developer has to type less
- The resulting code is clearer

Data Type Conversion

- Converts data to comparable data types
- Is of two types:
 - Implicit conversion
 - Explicit conversion
- Functions:
 - TO_CHAR
 - TO_DATE
 - TO_NUMBER
 - TO_TIMESTAMP

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In any programming language, converting one data type to another is a common requirement. PL/SQL can handle such conversions with scalar data types. Data type conversions can be of two types:

Implicit conversions: PL/SQL attempts to convert data types dynamically if they are mixed in a statement. Consider the following example:

```
DECLARE
    v_salary NUMBER(6) := 6000;
    v_sal_hike VARCHAR2(5) := '1000';
    v_total_salary v_salary%TYPE;
BEGIN
    v_total_salary := v_salary + v_sal_hike;
    DBMS_OUTPUT.PUT_LINE(v_total_salary);
END;
/
```

In this example, the `sal_hike` variable is of the `VARCHAR2` type. When calculating the total salary, PL/SQL first converts `sal_hike` to `NUMBER`, and then performs the operation. The result is of the `NUMBER` type.

Implicit conversions can be between:

- Characters and numbers
- Characters and dates

Explicit conversions: To convert values from one data type to another, use built-in functions. For example, to convert a CHAR value to a DATE or NUMBER value, use TO_DATE or TO_NUMBER, respectively.

Data Type Conversion

1

```
-- implicit data type conversion  
v_date_of_joining DATE:= '02-Feb-2000';
```

2

```
-- error in data type conversion  
v_date_of_joining DATE:= 'February 02,2000';
```

3

```
-- explicit data type conversion  
v_date_of_joining DATE:= TO_DATE('February  
02,2000','Month DD, YYYY');
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Note the three examples of implicit and explicit conversions of the DATE data type in the slide:

1. Because the string literal being assigned to date_of_joining is in the default format, this example performs implicit conversion and assigns the specified date to date_of_joining.
2. The PL/SQL returns an error because the date that is being assigned is not in the default format.
3. The TO_DATE function is used to explicitly convert the given date in a particular format and assign it to the DATE data type variable date_of_joining.

Agenda

- Writing executable statements in a PL/SQL block
- Writing nested blocks
- Using operators and developing readable code

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Nested Blocks

PL/SQL blocks can be nested.

- An executable section (`BEGIN ... END`) can contain nested blocks.
- An exception section can contain nested blocks.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Being procedural gives PL/SQL the ability to nest statements. You can nest blocks wherever an executable statement is allowed, thus making the nested block a statement. If your executable section has code for many logically related functionalities to support multiple business requirements, you can divide the executable section into smaller blocks. The exception section can also contain nested blocks.

Nested Blocks: Example

```
DECLARE
  v_outer_variable VARCHAR2(20) := 'GLOBAL VARIABLE';
BEGIN
  DECLARE
    v_inner_variable VARCHAR2(20) := 'LOCAL VARIABLE';
  BEGIN
    DBMS_OUTPUT.PUT_LINE(v_inner_variable);
    DBMS_OUTPUT.PUT_LINE(v_outer_variable);
  END;
  DBMS_OUTPUT.PUT_LINE(v_outer_variable);
END;
```

```
anonymous block completed
LOCAL VARIABLE
GLOBAL VARIABLE
GLOBAL VARIABLE
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example shown in the slide has an outer (parent) block and a nested (child) block. The `v_outer_variable` variable is declared in the outer block and the `v_inner_variable` variable is declared in the inner block.

`v_outer_variable` is local to the outer block but global to the inner block. When you access this variable in the inner block, PL/SQL first looks for a local variable in the inner block with that name. There is no variable with the same name in the inner block, so PL/SQL looks for the variable in the outer block. Therefore, `v_outer_variable` is considered to be the global variable for all the enclosing blocks. You can access this variable in the inner block as shown in the slide. Variables declared in a PL/SQL block are considered local to that block and global to all its subblocks.

`v_inner_variable` is local to the inner block and is not global because the inner block does not have any nested blocks. This variable can be accessed only within the inner block. If PL/SQL does not find the variable declared locally, it looks upward in the declarative section of the parent blocks. PL/SQL does not look downward in the child blocks.

Variable Scope and Visibility

```
DECLARE
    v_father_name VARCHAR2(20) := 'Patrick';
    v_date_of_birth DATE := '20-Apr-1972';
BEGIN
    DECLARE
        v_child_name VARCHAR2(20) := 'Mike';
        v_date_of_birth DATE := '12-Dec-2002';
    BEGIN
        DBMS_OUTPUT.PUT_LINE('Father''s Name: ' || v_father_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: ' || v_date_of_birth);
        DBMS_OUTPUT.PUT_LINE('Child''s Name: ' || v_child_name);
    END;
    DBMS_OUTPUT.PUT_LINE('Date of Birth: ' || v_date_of_birth);
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The output of the block shown in the slide is as follows:

```
anonymous block completed
Father's Name: Patrick
Date of Birth: 12-DEC-02
Child's Name: Mike
Date of Birth: 20-APR-72
```

Examine the date of birth that is printed for father and child. The output does not provide the correct information, because the scope and visibility of the variables are not applied correctly.

- The *scope* of a variable is the portion of the program in which the variable is declared and is accessible.
- The *visibility* of a variable is the portion of the program where the variable can be accessed without using a qualifier.

Scope

- The `v_father_name` variable and the first occurrence of the `v_date_of_birth` variable are declared in the outer block. These variables have the scope of the block in which they are declared. Therefore, the scope of these variables is limited to the outer block.

Scope

- The `v_child_name` and `v_date_of_birth` variables are declared in the inner block or the nested block. These variables are accessible only within the nested block and are not accessible in the outer block. When a variable is out of scope, PL/SQL frees the memory used to store the variable; therefore, these variables cannot be referenced.

Visibility

- The `v_date_of_birth` variable declared in the outer block has scope even in the inner block. However, this variable is not visible in the inner block because the inner block has a local variable with the same name.
 - Examine the code in the executable section of the PL/SQL block. You can print the father's name, the child's name, and the date of birth. Only the child's date of birth can be printed here because the father's date of birth is not visible.
 - The father's date of birth is visible in the outer block and, therefore, can be printed.

Note: You cannot have variables with the same name in a block. However, as shown in this example, you can declare variables with the same name in two different blocks (nested blocks). The two items represented by identifiers are distinct; changes in one do not affect the other.

Using a Qualifier with Nested Blocks

```
BEGIN <>outer>>
DECLARE
    v_father_name VARCHAR2(20) :='Patrick';
    v_date_of_birth DATE:='20-Apr-1972';
BEGIN
    DECLARE
        v_child_name VARCHAR2(20) :='Mike';
        v_date_of_birth DATE:='12-Dec-2002';
    BEGIN
        DBMS_OUTPUT.PUT_LINE('Father''s Name: '||v_father_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: '
                            ||outer.v_date_of_birth);
        DBMS_OUTPUT.PUT_LINE('Child''s Name: '||v_child_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: '||v_date_of_birth);
    END;
END;
END outer;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A *qualifier* is a label given to a block. You can use a qualifier to access the variables that have scope but are not visible.

Example

In the code example:

- The outer block is labeled `outer`
- Within the inner block, the `outer` qualifier is used to access the `v_date_of_birth` variable that is declared in the outer block. Therefore, the father's date of birth and the child's date of birth can both be printed from within the inner block.
- The output of the code in the slide shows the correct information:

```
anonymous block completed
Father's Name: Patrick
Date of Birth: 20-APR-72
Child's Name: Mike
Date of Birth: 12-DEC-02
```

Note: Labeling is not limited to the outer block. You can label any block.

Challenge: Determining Variable Scope

```
BEGIN <>outer>>
DECLARE
    v_sal      NUMBER(7,2) := 60000;
    v_comm     NUMBER(7,2) := v_sal * 0.20;
    v_message  VARCHAR2(255) := ' eligible for commission';
BEGIN
    DECLARE
        v_sal      NUMBER(7,2) := 50000;
        v_comm     NUMBER(7,2) := 0;
        v_total_comp NUMBER(7,2) := v_sal + v_comm;
    BEGIN
        v_message := 'CLERK not'||v_message;
        outer.v_comm := v_sal * 0.30;
    END;
    v_message := 'SALESMAN'||v_message;
END;
END outer;
/
```

1
2

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Evaluate the PL/SQL block in the slide. Determine each of the following values according to the rules of scoping:

1. Value of `v_message` at position 1
2. Value of `v_total_comp` at position 2
3. Value of `v_comm` at position 1
4. Value of `outer.v_comm` at position 1
5. Value of `v_comm` at position 2
6. Value of `v_message` at position 2

Answers: Determining Variable Scope

Answers to the questions of scope are as follows:

1. Value of `v_message` at position 1: **CLERK not eligible for commission**
2. Value of `v_total_comp` at position 2: **Error. `v_total_comp` is not visible here because it is defined within the inner block.**
3. Value of `v_comm` at position 1: **0**
4. Value of `outer.v_comm` at position 1: **12000**
5. Value of `v_comm` at position 2: **15000**
6. Value of `v_message` at position 2: **SALESMANCLERK not eligible for commission**

Agenda

- Writing executable statements in a PL/SQL block
- Writing nested blocks
- Using operators and developing readable code

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Operators in PL/SQL

- Logical
 - Arithmetic
 - Concatenation
 - Parentheses to control order of operations
-
- Exponential operator (**)

Same as in SQL

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The operations in an expression are performed in a particular order depending on their precedence (priority). The following table shows the default order of operations from high priority to low priority:

Operator	Operation
**	Exponentiation
+, -	Identity, negation
*, /	Multiplication, division
+, -,	Addition, subtraction, concatenation
=, <, >, <=, >=, <>, !=, ~=, ^=, IS NULL, LIKE, BETWEEN, IN	Comparison
NOT	Logical negation
AND	Conjunction
OR	Inclusion

Operators in PL/SQL: Examples

- Increment the counter for a loop.

```
loop_count := loop_count + 1;
```

- Set the value of a Boolean flag.

```
good_sal := sal BETWEEN 50000 AND 150000;
```

- Validate whether an employee number contains a value.

```
valid := (empno IS NOT NULL);
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When you are working with nulls, you can avoid some common mistakes by keeping in mind the following rules:

- Comparisons involving nulls always yield `NULL`.
- Applying the logical operator `NOT` to a null yields `NULL`.
- In conditional control statements, if the condition yields `NULL`, its associated sequence of statements is not executed.

Programming Guidelines

Make code maintenance easier by:

- Documenting code with comments
- Developing a case convention for the code
- Developing naming conventions for identifiers and other objects
- Enhancing readability by indenting

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Follow programming guidelines shown in the slide to produce clear code and reduce maintenance when developing a PL/SQL block.

Code Conventions

The following table provides guidelines for writing code in uppercase or lowercase characters to help distinguish keywords from named objects.

Category	Case Convention	Examples
SQL statements	Uppercase	SELECT, INSERT
PL/SQL keywords	Uppercase	DECLARE, BEGIN, IF
Data types	Uppercase	VARCHAR2, BOOLEAN
Identifiers and parameters	Lowercase	v_sal, emp_cursor, g_sal, p_empno
Database tables	Lowercase, plural	employees, departments
Database columns	Lowercase, singular	employee_id, department_id

Indenting Code

For clarity, indent each level of code.

```
BEGIN
    IF x=0 THEN
        y:=1;
    END IF;
END;
/
```

```
DECLARE
    v_deptno          NUMBER(4);
    v_location_id    NUMBER(4);
BEGIN
    SELECT department_id,
           location_id
    INTO   deptno,
           v_location_id
    FROM   departments
    WHERE   department_name
            = 'Sales';
    ...
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

For clarity and enhanced readability, indent each level of code. To show structure, you can divide lines by using carriage returns and you can indent lines by using spaces and tabs. Compare the following IF statements for readability:

```
IF x>y THEN max:=x;ELSE max:=y;END IF;
```

```
IF x > y THEN
    max := x;
ELSE
    max := y;
END IF;
```

Quiz

You can use most SQL single-row functions such as number, character, conversion, and date single-row functions in PL/SQL expressions.

- a. True
- b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a

SQL Functions in PL/SQL

SQL provides several predefined functions that can be used in SQL statements. Most of these functions (such as single-row number and character functions, data type conversion functions, and date and time-stamp functions) are valid in PL/SQL expressions.

The following functions are not available in procedural statements:

- DECODE
- Group functions: AVG, MIN, MAX, COUNT, SUM, STDDEV, and VARIANCE
Group functions apply to groups of rows in a table and are, therefore, available only in SQL statements in a PL/SQL block. The functions mentioned here are only a subset of the complete list.

Summary

In this lesson, you should have learned how to:

- Identify lexical units in a PL/SQL block
- Use built-in SQL functions in PL/SQL
- Write nested blocks to break logically related functionalities
- Decide when to perform explicit conversions
- Qualify variables in nested blocks
- Use sequences in PL/SQL expressions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Because PL/SQL is an extension of SQL, the general syntax rules that apply to SQL also apply to PL/SQL.

A block can have any number of nested blocks defined within its executable part. Blocks defined within a block are called subblocks. You can nest blocks only in the executable part of a block. Because the exception section is also a part of the executable section, it can also contain nested blocks. Ensure correct scope and visibility of the variables when you have nested blocks. Avoid using the same identifiers in the parent and child blocks.

Most of the functions available in SQL are also valid in PL/SQL expressions. Conversion functions convert a value from one data type to another. Comparison operators compare one expression with another. The result is always TRUE, FALSE, or NULL. Typically, you use comparison operators in conditional control statements and in the WHERE clause of SQL data manipulation statements. The relational operators enable you to compare arbitrarily-complex expressions.

Practice 4: Overview

This practice covers the following topics:

- Reviewing scoping and nesting rules
- Writing and testing PL/SQL blocks

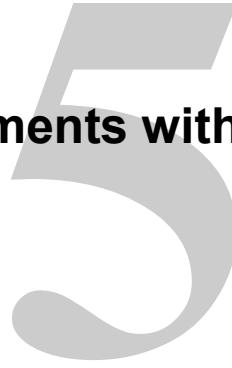

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Exercises 1 and 2 are paper based.

Oracle University and Ventara AG use only

Using SQL Statements within a PL/SQL Block

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Determine the SQL statements that can be directly included in a PL/SQL executable block
- Manipulate data with DML statements in PL/SQL
- Use transaction control statements in PL/SQL
- Make use of the `INTO` clause to hold the values returned by a SQL statement
- Differentiate between implicit cursors and explicit cursors
- Use SQL cursor attributes

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this lesson, you learn to embed standard SQL `SELECT`, `INSERT`, `UPDATE`, `DELETE`, and `MERGE` statements in PL/SQL blocks. You learn how to include data manipulation language (DML) and transaction control statements in PL/SQL. You learn the need for cursors and differentiate between the two types of cursors. The lesson also presents the various SQL cursor attributes that can be used with implicit cursors.

Agenda

- Retrieving data with PL/SQL
- Manipulating data with PL/SQL
- Introducing SQL cursors

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL Statements in PL/SQL

- Retrieve a row from the database by using the SELECT command.
- Make changes to rows in the database by using DML commands.
- Control a transaction with the COMMIT, ROLLBACK, or SAVEPOINT command.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In a PL/SQL block, you use SQL statements to retrieve and modify data from the database table. PL/SQL supports data manipulation language (DML) and transaction control commands. You can use DML commands to modify the data in a database table. However, remember the following points while using DML statements and transaction control commands in PL/SQL blocks:

- The END keyword signals the end of a PL/SQL block, not the end of a transaction. Just as a block can span multiple transactions, a transaction can span multiple blocks.
- PL/SQL does not directly support data definition language (DDL) statements such as CREATE TABLE, ALTER TABLE, or DROP TABLE. PL/SQL supports early binding, which cannot happen if applications have to create database objects at run time by passing values. DDL statements cannot be directly executed. These statements are dynamic SQL statements. Dynamic SQL statements are built as character strings at run time and can contain placeholders for parameters. Therefore, you can use dynamic SQL to execute your DDL statements in PL/SQL. The details of working with dynamic SQL are covered in the course titled *Oracle Database: Develop PL/SQL Program Units*.
- PL/SQL does not directly support data control language (DCL) statements such as GRANT or REVOKE. You can use dynamic SQL to execute them.

SELECT Statements in PL/SQL

Retrieve data from the database with a SELECT statement.

Syntax:

```
SELECT  select_list
INTO    { variable_name [, variable_name] ...
        | record_name }
FROM    table
[WHERE  condition];
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use the SELECT statement to retrieve data from the database.

Guidelines for Retrieving Data in PL/SQL

- Terminate each SQL statement with a semicolon (;).
- Every value retrieved must be stored in a variable by using the INTO clause.
- The WHERE clause is optional and can be used to specify input variables, constants, literals, and PL/SQL expressions. However, when you use the INTO clause, you should fetch only one row; using the WHERE clause is required in such cases.

select_list List of at least one column; can include SQL expressions, row functions, or group functions

variable_name Scalar variable that holds the retrieved value

record_name PL/SQL record that holds the retrieved values

table Specifies the database table name

condition Is composed of column names, expressions, constants, and comparison operators, including PL/SQL variables and constants

- Specify the same number of variables in the `INTO` clause as the number of database columns in the `SELECT` clause. Be sure that they correspond positionally and that their data types are compatible.
- Use group functions, such as `SUM`, in a SQL statement, because group functions apply to groups of rows in a table.

SELECT Statements in PL/SQL

- The INTO clause is required.
- Queries must return only one row.

```
DECLARE
  v_fname VARCHAR2(25);
BEGIN
  SELECT first_name INTO v_fname
  FROM employees WHERE employee_id=200;
  DBMS_OUTPUT.PUT_LINE(' First Name is : '||v_fname);
END;
/
```

anonymous block completed
First Name is : Jennifer

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

INTO Clause

The INTO clause is mandatory and occurs between the SELECT and FROM clauses. It is used to specify the names of variables that hold the values that SQL returns from the SELECT clause. You must specify one variable for each item selected, and the order of the variables must correspond with the items selected.

Use the INTO clause to populate either PL/SQL variables or host variables.

Queries Must Return Only One Row

SELECT statements within a PL/SQL block fall into the ANSI classification of embedded SQL, for which the following rule applies: Queries must return only one row. A query that returns more than one row or no row generates an error.

PL/SQL manages these errors by raising standard exceptions, which you can handle in the exception section of the block with the NO_DATA_FOUND and TOO_MANY_ROWS exceptions. Include a WHERE condition in the SQL statement so that the statement returns a single row. You learn about exception handling in the lesson titled “Handling Exceptions.”

Note: In all cases where DBMS_OUTPUT.PUT_LINE is used in the code examples, the SET SERVEROUTPUT ON statement precedes the block.

How to Retrieve Multiple Rows from a Table and Operate on the Data

A SELECT statement with the INTO clause can retrieve only one row at a time. If your requirement is to retrieve multiple rows and operate on the data, you can make use of explicit cursors. You are introduced to cursors later in this lesson and learn about explicit cursors in the lesson titled “Using Explicit Cursors.”

Retrieving Data in PL/SQL: Example

Retrieve hire_date and salary for the specified employee.

```
DECLARE
  v_emp_hiredate    employees.hire_date%TYPE;
  v_emp_salary      employees.salary%TYPE;
BEGIN
  SELECT    hire_date, salary
  INTO      v_emp_hiredate, v_emp_salary
  FROM      employees
  WHERE     employee_id = 100;
  DBMS_OUTPUT.PUT_LINE ('Hire date is :'|| v_emp_hiredate);
  DBMS_OUTPUT.PUT_LINE ('Salary is :'|| v_emp_salary);
END;
/
```

```
anonymous block completed
Hire date is :17-JUN-03
Salary is :24000
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, the `v_emp_hiredate` and `v_emp_salary` variables are declared in the declarative section of the PL/SQL block. In the executable section, the values of the `hire_date` and `salary` columns for the employee with the `employee_id` 100 are retrieved from the `employees` table. Next, they are stored in the `v_emp_hiredate` and `v_emp_salary` variables, respectively. Observe how the `INTO` clause, along with the `SELECT` statement, retrieves the database column values and stores them in the PL/SQL variables.

Note: The `SELECT` statement retrieves `hire_date`, and then `salary`. The variables in the `INTO` clause must thus be in the same order. For example, if you exchange `v_emp_hiredate` and `v_emp_salary` in the statement in the slide, the statement results in an error.

Retrieving Data in PL/SQL

Return the sum of salaries for all the employees in the specified department.

Example:

```
DECLARE
    v_sum_sal    NUMBER(10,2);
    v_deptno     NUMBER NOT NULL := 60;
BEGIN
    SELECT SUM(salary) -- group function
    INTO v_sum_sal  FROM employees
    WHERE department_id = v_deptno;
    DBMS_OUTPUT.PUT_LINE ('The sum of salary is ' || v_sum_sal);
END;
```

```
anonymous block completed
The sum of salary is 28800
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, the `v_sum_sal` and `v_deptno` variables are declared in the declarative section of the PL/SQL block. In the executable section, the total salary for the employees in the department with `department_id` 60 is computed using the SQL aggregate function `SUM`. The calculated total salary is assigned to the `v_sum_sal` variable.

Note: Group functions cannot be used in PL/SQL syntax. They must be used in SQL statements within a PL/SQL block as shown in the example in the slide.

For instance, you *cannot* use group functions using the following syntax:

```
V_sum_sal := SUM(employees.salary);
```

Naming Ambiguities

```
DECLARE
    hire_date      employees.hire_date%TYPE;
    sysdate        hire_date%TYPE;
    employee_id   employees.employee_id%TYPE := 176;
BEGIN
    SELECT      hire_date, sysdate
    INTO        hire_date, sysdate
    FROM        employees
    WHERE       employee_id = employee_id;
END;
/
```

```
Error report:
ORA-01422: exact fetch returns more than requested number of rows
ORA-06512: at line 6
01422. 00000 - "exact fetch returns more than requested number of rows"
*Cause:    The number specified in exact fetch is less than the rows returned.
>Action:   Rewrite the query or change number of rows requested
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In potentially ambiguous SQL statements, the names of database columns take precedence over the names of local variables.

The example shown in the slide is defined as follows: Retrieve the hire date and today's date from the `employees` table for `employee_id` 176. This example raises an unhandled run-time exception because, in the `WHERE` clause, the PL/SQL variable names are the same as the database column names in the `employees` table.

The following `DELETE` statement removes all employees from the `employees` table, where the last name is not null (not just "King"), because the Oracle Server assumes that both occurrences of `last_name` in the `WHERE` clause refer to the database column:

```
DECLARE
    last_name VARCHAR2(25) := 'King';
BEGIN
    DELETE FROM employees WHERE last_name = last_name;
    . . .
```

Naming Conventions

- Use a naming convention to avoid ambiguity in the WHERE clause.
- Avoid using database column names as identifiers.
- Syntax errors can arise because PL/SQL checks the database first for a column in the table.
- The names of local variables and formal parameters take precedence over the names of database *tables*.
- The names of database table *columns* take precedence over the names of local variables.
- The names of variables take precedence over the function names.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Avoid ambiguity in the WHERE clause by adhering to a naming convention that distinguishes database column names from PL/SQL variable names.

- Database columns and identifiers should have distinct names.
- Syntax errors can arise because PL/SQL checks the database first for a column in the table.

Agenda

- Retrieving data with PL/SQL
- Manipulating data with PL/SQL
- Introducing SQL cursors

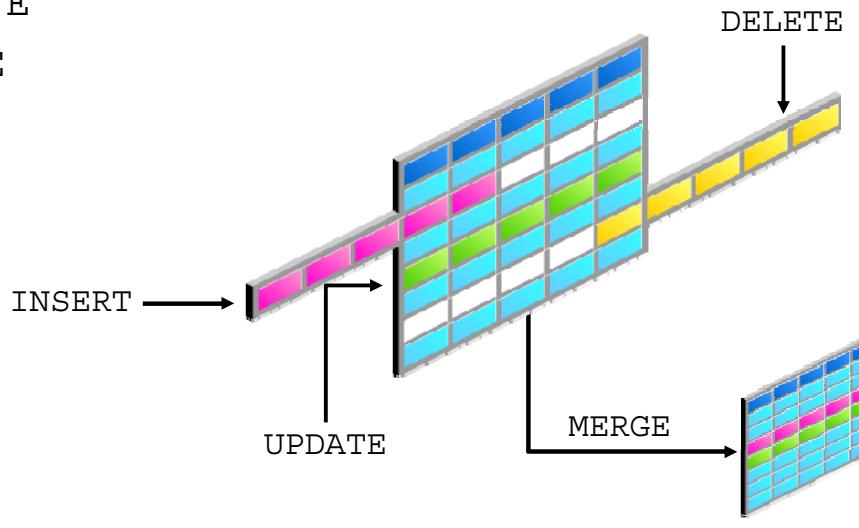

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Using PL/SQL to Manipulate Data

Make changes to database tables by using DML commands:

- INSERT
- UPDATE
- DELETE
- MERGE

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You manipulate data in the database by using DML commands. You can issue DML commands such as `INSERT`, `UPDATE`, `DELETE`, and `MERGE` without restriction in PL/SQL. Row locks (and table locks) are released by including the `COMMIT` or `ROLLBACK` statements in the PL/SQL code.

- The `INSERT` statement adds new rows to the table.
- The `UPDATE` statement modifies existing rows in the table.
- The `DELETE` statement removes rows from the table.
- The `MERGE` statement selects rows from one table to update or insert into another table. The decision whether to update or insert into the target table is based on a condition in the `ON` clause.

Note: `MERGE` is a deterministic statement. That is, you cannot update the same row of the target table multiple times in the same `MERGE` statement. You must have `INSERT` and `UPDATE` object privileges on the target table and `SELECT` privilege on the source table.

Inserting Data: Example

Add new employee information to the EMPLOYEES table.

```
BEGIN
  INSERT INTO employees
    (employee_id, first_name, last_name, email,
     hire_date, job_id, salary)
    VALUES(employees_seq.NEXTVAL, 'Ruth', 'Cores',
           'RCORES', CURRENT_DATE, 'AD_ASST', 4000);
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, an `INSERT` statement is used within a PL/SQL block to insert a record into the `employees` table. While using the `INSERT` command in a PL/SQL block, you can:

- Use SQL functions such as `USER` and `CURRENT_DATE`
- Generate primary key values by using existing database sequences
- Derive values in the PL/SQL block

Note: The data in the `employees` table needs to remain unchanged. Even though the `employees` table is not read-only, inserting, updating, and deleting are not allowed on this table to ensure consistency of output. Therefore, the command rollback is used as shown in the code for slide 15_sa in `code_ex_05.sql`.

Updating Data: Example

Increase the salary of all employees who are stock clerks.

```
DECLARE
    sal_increase    employees.salary%TYPE := 800;
BEGIN
    UPDATE      employees
    SET          salary = salary + sal_increase
    WHERE        job_id = 'ST_CLERK';
END;
/
```

```
anonymous block completed
FIRST_NAME      SALARY
-----
Julia           4000
Irene           3500
James           3200
Steven          3000
```

```
...
Curtis          3900
Randall         3400
Peter           3300
```

20 rows selected

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

There may be ambiguity in the `SET` clause of the `UPDATE` statement because, although the identifier on the left of the assignment operator is always a database column, the identifier on the right can be either a database column or a PL/SQL variable. Recall that if column names and identifier names are identical in the `WHERE` clause, the Oracle Server looks to the database first for the name.

Remember that the `WHERE` clause is used to determine the rows that are affected. If no rows are modified, no error occurs (unlike the `SELECT` statement in PL/SQL).

Note: PL/SQL variable assignments always use `:=`, and SQL column assignments always use `=`.

Deleting Data: Example

Delete rows that belong to department 10 from the employees table.

```
DECLARE
    deptno    employees.department_id%TYPE := 10;
BEGIN
    DELETE FROM employees
    WHERE department_id = deptno;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The `DELETE` statement removes unwanted rows from a table. If the `WHERE` clause is not used, all the rows in a table can be removed if there are no integrity constraints.

Merging Rows

Insert or update rows in the `copy_emp` table to match the `employees` table.

```
BEGIN
  MERGE INTO copy_emp c
    USING employees e
      ON (e.employee_id = c.empno)
  WHEN MATCHED THEN
    UPDATE SET
      c.first_name      = e.first_name,
      c.last_name       = e.last_name,
      c.email           = e.email,
      . . .
  WHEN NOT MATCHED THEN
    INSERT VALUES(e.employee_id, e.first_name, e.last_name,
                  . . ., e.department_id);
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The `MERGE` statement inserts or updates rows in one table by using data from another table. Each row is inserted or updated in the target table depending on an equijoin condition.

The example shown matches the `empno` column in the `copy_emp` table to the `employee_id` column in the `employees` table. If a match is found, the row is updated to match the row in the `employees` table. If the row is not found, it is inserted into the `copy_emp` table.

The complete example of using `MERGE` in a PL/SQL block is shown on the next slide.

```
BEGIN  
MERGE INTO copy_emp c  
    USING employees e  
    ON (e.employee_id = c.empno)  
WHEN MATCHED THEN  
    UPDATE SET  
        c.first_name      = e.first_name,  
        c.last_name       = e.last_name,  
        c.email           = e.email,  
        c.phone_number    = e.phone_number,  
        c.hire_date       = e.hire_date,  
        c.job_id          = e.job_id,  
        c.salary          = e.salary,  
        c.commission_pct  = e.commission_pct,  
        c.manager_id      = e.manager_id,  
        c.department_id   = e.department_id  
WHEN NOT MATCHED THEN  
    INSERT VALUES(e.employee_id,  e.first_name,  e.last_name,  
                  e.email,     e.phone_number, e.hire_date,  e.job_id,  
                  e.salary,    e.commission_pct, e.manager_id,  
                  e.department_id);  
END;  
/
```

Agenda

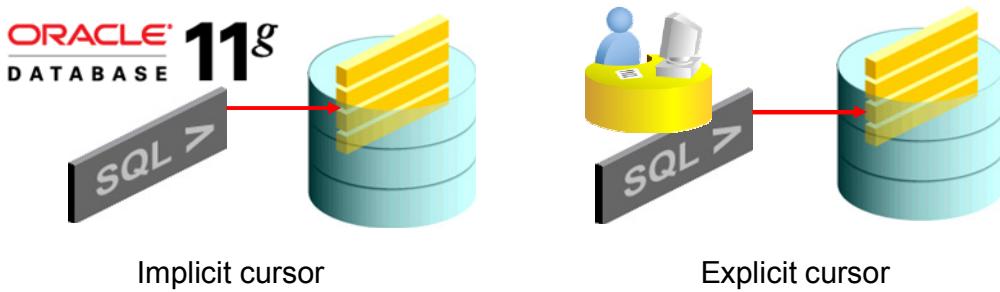

- Retrieving data with PL/SQL
- Manipulating data with PL/SQL
- Introducing SQL cursors

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL Cursor

- A cursor is a pointer to the private memory area allocated by the Oracle Server. It is used to handle the result set of a SELECT statement.
- There are two types of cursors: implicit and explicit.
 - **Implicit:** Created and managed internally by the Oracle Server to process SQL statements
 - **Explicit:** Declared explicitly by the programmer

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

ORACLE

You have already learned that you can include SQL statements that return a single row in a PL/SQL block. The data retrieved by the SQL statement should be held in variables using the INTO clause.

Where Does the Oracle Server Process SQL Statements?

The Oracle Server allocates a private memory area called the *context area* for processing SQL statements. The SQL statement is parsed and processed in this area. The information required for processing and the information retrieved after processing are all stored in this area. You have no control over this area because it is internally managed by the Oracle Server.

A cursor is a pointer to the context area. However, this cursor is an implicit cursor and is automatically managed by the Oracle Server. When the executable block issues a SQL statement, PL/SQL creates an implicit cursor.

Types of Cursors

There are two types of cursors:

- **Implicit:** An *implicit cursor* is created and managed by the Oracle Server. You do not have access to it. The Oracle Server creates such a cursor when it has to execute a SQL statement.

- **Explicit:** As a programmer, you may want to retrieve multiple rows from a database table, have a pointer to each row that is retrieved, and work on the rows one at a time. In such cases, you can declare cursors explicitly depending on your business requirements. A cursor that is declared by programmers is called an *explicit cursor*. You declare such a cursor in the declarative section of a PL/SQL block.

SQL Cursor Attributes for Implicit Cursors

Using SQL cursor attributes, you can test the outcome of your SQL statements.

SQL%FOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement affected at least one row
SQL%NOTFOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement did not affect even one row
SQL%ROWCOUNT	An integer value that represents the number of rows affected by the most recent SQL statement

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL cursor attributes enable you to evaluate what happened when an implicit cursor was last used. Use these attributes in PL/SQL statements but not in SQL statements.

You can test the `SQL%ROWCOUNT`, `SQL%FOUND`, and `SQL%NOTFOUND` attributes in the executable section of a block to gather information after the appropriate DML command executes. PL/SQL does not return an error if a DML statement does not affect rows in the underlying table. However, if a `SELECT` statement does not retrieve any rows, PL/SQL returns an exception.

Observe that the attributes are prefixed with `SQL`. These cursor attributes are used with implicit cursors that are automatically created by PL/SQL and for which you do not know the names. Therefore, you use `SQL` instead of the cursor name.

The `SQL%NOTFOUND` attribute is the opposite of `SQL%FOUND`. This attribute may be used as the exit condition in a loop. It is useful in `UPDATE` and `DELETE` statements when no rows are changed because exceptions are not returned in these cases.

You learn about explicit cursor attributes in the lesson titled “Using Explicit Cursors.”

SQL Cursor Attributes for Implicit Cursors

Delete rows that have the specified employee ID from the employees table. Print the number of rows deleted.

Example:

```
DECLARE
    v_rows_deleted VARCHAR2(30);
    v_empno employees.employee_id%TYPE := 176;
BEGIN
    DELETE FROM employees
    WHERE employee_id = v_empno;
    v_rows_deleted := (SQL%ROWCOUNT ||
                       ' row deleted.');
    DBMS_OUTPUT.PUT_LINE (v_rows_deleted);
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide deletes a row with employee_id 176 from the employees table. Using the SQL%ROWCOUNT attribute, you can print the number of rows deleted.

Quiz

When using the `SELECT` statement in PL/SQL, the `INTO` clause is required and queries can return one or more rows.

- a. True
- b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: b

INTO Clause

The `INTO` clause is mandatory and occurs between the `SELECT` and `FROM` clauses. It is used to specify the names of variables that hold the values that SQL returns from the `SELECT` clause. You must specify one variable for each item selected, and the order of the variables must correspond with the items selected.

Use the `INTO` clause to populate either PL/SQL variables or host variables.

Queries Must Return Only One Row

`SELECT` statements within a PL/SQL block fall into the ANSI classification of embedded SQL, for which the following rule applies: Queries must return only one row. A query that returns more than one row or no row generates an error.

PL/SQL manages these errors by raising standard exceptions, which you can handle in the exception section of the block with the `NO_DATA_FOUND` and `TOO_MANY_ROWS` exceptions. Include a `WHERE` condition in the SQL statement so that the statement returns a single row. You learn about exception handling later in the course.

Summary

In this lesson, you should have learned how to:

- Embed DML statements, transaction control statements, and DDL statements in PL/SQL
- Use the `INTO` clause, which is mandatory for all `SELECT` statements in PL/SQL
- Differentiate between implicit cursors and explicit cursors
- Use SQL cursor attributes to determine the outcome of SQL statements

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

DML commands and transaction control statements can be used in PL/SQL programs without restriction. However, the DDL commands cannot be used directly.

A `SELECT` statement in a PL/SQL block can return only one row. It is mandatory to use the `INTO` clause to hold the values retrieved by the `SELECT` statement.

A cursor is a pointer to the memory area. There are two types of cursors. Implicit cursors are created and managed internally by the Oracle Server to execute SQL statements. You can use SQL cursor attributes with these cursors to determine the outcome of the SQL statement. Explicit cursors are declared by programmers.

Practice 5: Overview

This practice covers the following topics:

- Selecting data from a table
- Inserting data into a table
- Updating data in a table
- Deleting a record from a table

Writing Control Structures

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Identify the uses and types of control structures
- Construct an IF statement
- Use CASE statements and CASE expressions
- Construct and identify loop statements
- Use guidelines when using conditional control structures

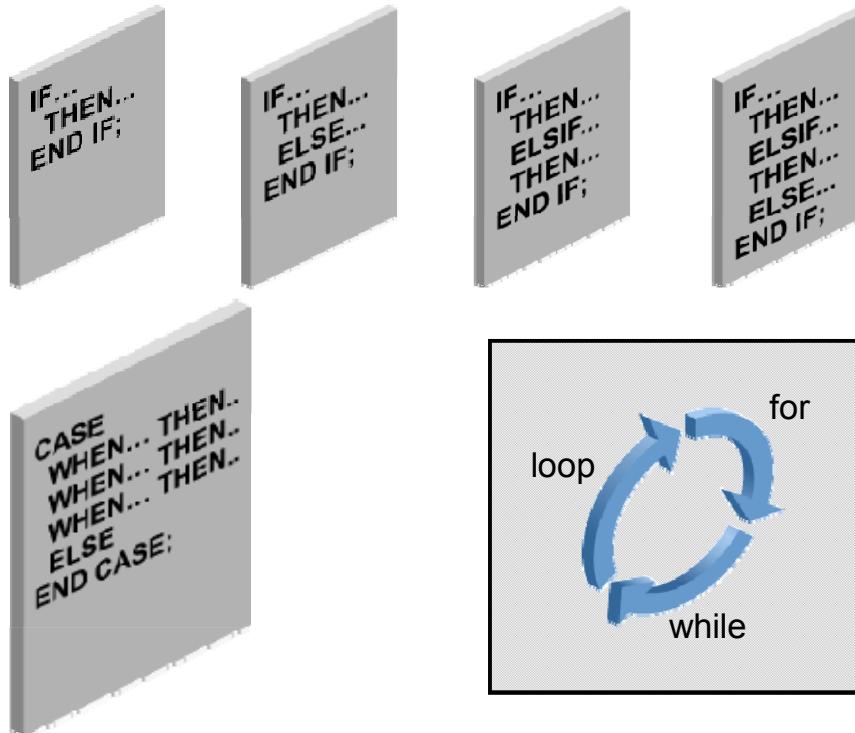

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have learned to write PL/SQL blocks containing declarative and executable sections. You have also learned to include expressions and SQL statements in the executable block.

In this lesson, you learn how to use control structures such as IF statements, CASE expressions, and LOOP structures in a PL/SQL block.

Controlling Flow of Execution

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can change the logical flow of statements within the PL/SQL block with a number of control structures. This lesson addresses four types of PL/SQL control structures: conditional constructs with the `IF` statement, `CASE` expressions, `LOOP` control structures, and the `CONTINUE` statement.

Agenda

- Using IF statements
- Using CASE statements and CASE expressions
- Constructing and identifying loop statements

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

IF Statement

Syntax:

```
IF condition THEN  
    statements;  
[ELSIF condition THEN  
    statements;]  
[ELSE  
    statements;]  
END IF;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The structure of the PL/SQL IF statement is similar to the structure of IF statements in other procedural languages. It allows PL/SQL to perform actions selectively based on conditions.

In the syntax:

<i>condition</i>	Is a Boolean variable or expression that returns TRUE, FALSE, or NULL
THEN	Introduces a clause that associates the Boolean expression with the sequence of statements that follows it
<i>statements</i>	Can be one or more PL/SQL or SQL statements. (They may include additional IF statements containing several nested IF, ELSE, and ELSIF statements.) The statements in the THEN clause are executed only if the condition in the associated IF clause evaluates to TRUE.

In the syntax:

- ELSIF Is a keyword that introduces a Boolean expression (If the first condition yields FALSE or NULL, the ELSIF keyword introduces additional conditions.)
- ELSE Introduces the default clause that is executed if and only if none of the earlier predicates (introduced by IF and ELSIF) are TRUE. The tests are executed in sequence so that a later predicate that might be true is preempted by an earlier predicate that is true.
- END IF Marks the end of an IF statement

Note: ELSIF and ELSE are optional in an IF statement. You can have any number of ELSIF keywords but only one ELSE keyword in your IF statement. END IF marks the end of an IF statement and must be terminated by a semicolon.

Simple IF Statement

```
DECLARE
    v_myage  number:=31;
BEGIN
    IF v_myage  < 11
    THEN
        DBMS_OUTPUT.PUT_LINE(' I am a child ');
    END IF;
END ;
/
```

anonymous block completed

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Simple IF Example

The slide shows an example of a simple IF statement with the THEN clause.

- The v_myage variable is initialized to 31.
- The condition for the IF statement returns FALSE because v_myage is not less than 11.
- Therefore, the control never reaches the THEN clause.

Adding Conditional Expressions

An IF statement can have multiple conditional expressions related with logical operators such as AND, OR, and NOT.

For example:

```
IF (myfirstname='Christopher' AND v_myage <11)
...
```

The condition uses the AND operator and, therefore, evaluates to TRUE only if both conditions are evaluated as TRUE. There is no limitation on the number of conditional expressions. However, these statements must be related with appropriate logical operators.

IF THEN ELSE Statement

```
DECLARE
    v_myage  number:=31;
BEGIN
    IF
        v_myage < 11 THEN
            DBMS_OUTPUT.PUT_LINE(' I am a child ');
    ELSE
        DBMS_OUTPUT.PUT_LINE(' I am not a child ');
    END IF;
END;
/
```

```
anonymous block completed
I am not a child
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An **ELSE** clause is added to the code in the previous slide. The condition has not changed and, therefore, still evaluates to FALSE. Recall that the statements in the **THEN** clause are executed only if the condition returns TRUE. In this case, the condition returns FALSE and the control moves to the **ELSE** statement.

The output of the block is shown below the code.

IF ELSIF ELSE Clause

```
DECLARE
    v_myage number:=31;
BEGIN
    IF v_myage < 11 THEN
        DBMS_OUTPUT.PUT_LINE(' I am a child ');
    ELSIF v_myage < 20 THEN
        DBMS_OUTPUT.PUT_LINE(' I am young ');
    ELSIF v_myage < 30 THEN
        DBMS_OUTPUT.PUT_LINE(' I am in my twenties');
    ELSIF v_myage < 40 THEN
        DBMS_OUTPUT.PUT_LINE(' I am in my thirties');
    ELSE
        DBMS_OUTPUT.PUT_LINE(' I am always young ');
    END IF;
END;
/
```

anonymous block completed
I am in my thirties

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The `IF` clause may contain multiple `ELSIF` clauses and an `ELSE` clause. The example illustrates the following characteristics of these clauses:

- The `ELSIF` clauses can have conditions, unlike the `ELSE` clause.
- The condition for `ELSIF` should be followed by the `THEN` clause, which is executed if the condition for `ELSIF` returns TRUE.
- When you have multiple `ELSIF` clauses, if the first condition is FALSE or NULL, the control shifts to the next `ELSIF` clause.
- Conditions are evaluated one by one from the top.
- If all conditions are FALSE or NULL, the statements in the `ELSE` clause are executed.
- The final `ELSE` clause is optional.

In the example, the output of the block is shown below the code.

NULL Value in IF Statement

```
DECLARE
    v_myage  number;
BEGIN
    IF v_myage  < 11 THEN
        DBMS_OUTPUT.PUT_LINE(' I am a child ');
    ELSE
        DBMS_OUTPUT.PUT_LINE(' I am not a child ');
    END IF;
END;
/
```

```
anonymous block completed
I am not a child
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example shown in the slide, the variable `v_myage` is declared but not initialized. The condition in the `IF` statement returns `NULL` rather than `TRUE` or `FALSE`. In such a case, the control goes to the `ELSE` statement.

Guidelines

- You can perform actions selectively based on conditions that are being met.
- When you write code, remember the spelling of the keywords:
 - `ELSIF` is one word.
 - `END IF` is two words.
- If the controlling Boolean condition is `TRUE`, the associated sequence of statements is executed; if the controlling Boolean condition is `FALSE` or `NULL`, the associated sequence of statements is passed over. Any number of `ELSIF` clauses is permitted.
- Indent the conditionally executed statements for clarity.

Agenda

- Using IF statements
- Using CASE statements and CASE expressions
- Constructing and identifying loop statements

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

CASE Expressions

- A CASE expression selects a result and returns it.
- To select the result, the CASE expression uses expressions. The value returned by these expressions is used to select one of several alternatives.

```
CASE selector
    WHEN expression1 THEN result1
        [WHEN expression2 THEN result2
            ...
            WHEN expressionN THEN resultN]
        [ELSE resultN+1]
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A CASE expression returns a result based on one or more alternatives. To return the result, the CASE expression uses a *selector*, which is an expression whose value is used to return one of several alternatives. The selector is followed by one or more WHEN clauses that are checked sequentially. The value of the selector determines which result is returned. If the value of the selector equals the value of a WHEN clause expression, that WHEN clause is executed and that result is returned.

PL/SQL also provides a searched CASE expression, which has the form:

```
CASE
    WHEN search_condition1 THEN result1
        [WHEN search_condition2 THEN result2
            ...
            WHEN search_conditionN THEN resultN]
        [ELSE resultN+1]
END;
```

A searched CASE expression has no selector. Furthermore, the WHEN clauses in CASE expressions contain search conditions that yield a Boolean value rather than expressions that can yield a value of any type.

CASE Expressions: Example

```
SET VERIFY OFF
DECLARE
    v_grade CHAR(1) := UPPER('&grade');
    v_appraisal VARCHAR2(20);
BEGIN
    v_appraisal := CASE v_grade
        WHEN 'A' THEN 'Excellent'
        WHEN 'B' THEN 'Very Good'
        WHEN 'C' THEN 'Good'
        ELSE 'No such grade'
    END;
    DBMS_OUTPUT.PUT_LINE ('Grade: '|| v_grade || 
                          'Appraisal' || v_appraisal);
END;
/
```

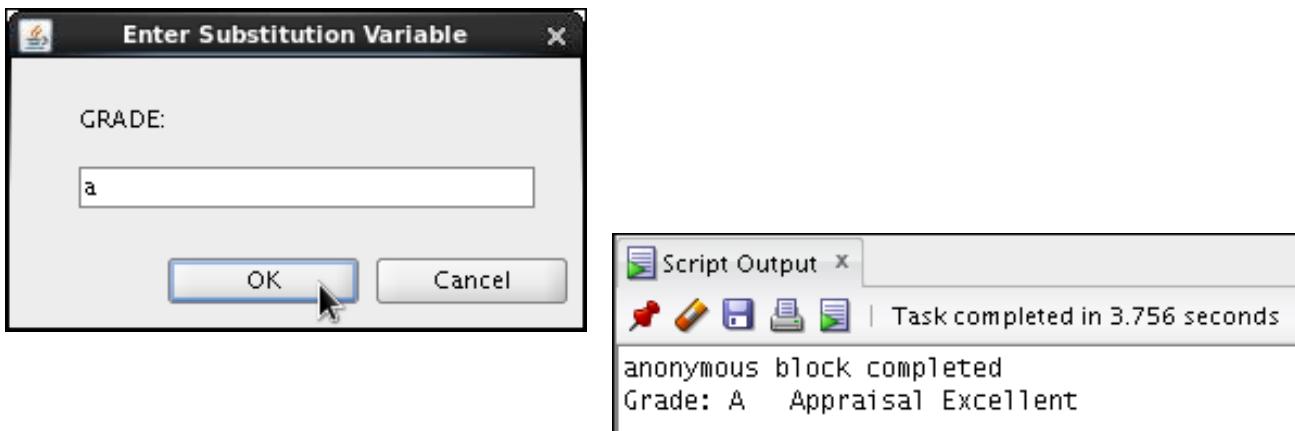

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, the `CASE` expression uses the value in the `v_grade` variable as the expression. This value is accepted from the user by using a substitution variable. Based on the value entered by the user, the `CASE` expression returns the value of the `v_appraisal` variable based on the value of the `v_grade` value.

Result

When you enter `a` or `A` for `v_grade`, as shown in the Substitution Variable window, the output of the example is as follows:

Searched CASE Expressions

```
DECLARE
    v_grade  CHAR(1) := UPPER('&grade');
    v_appraisal VARCHAR2(20);
BEGIN
    v_appraisal := CASE
        WHEN v_grade = 'A' THEN 'Excellent'
        WHEN v_grade IN ('B', 'C') THEN 'Good'
        ELSE 'No such grade'
    END;
    DBMS_OUTPUT.PUT_LINE ('Grade: ' || v_grade || 
                          ' Appraisal ' || v_appraisal);
END;
/
```

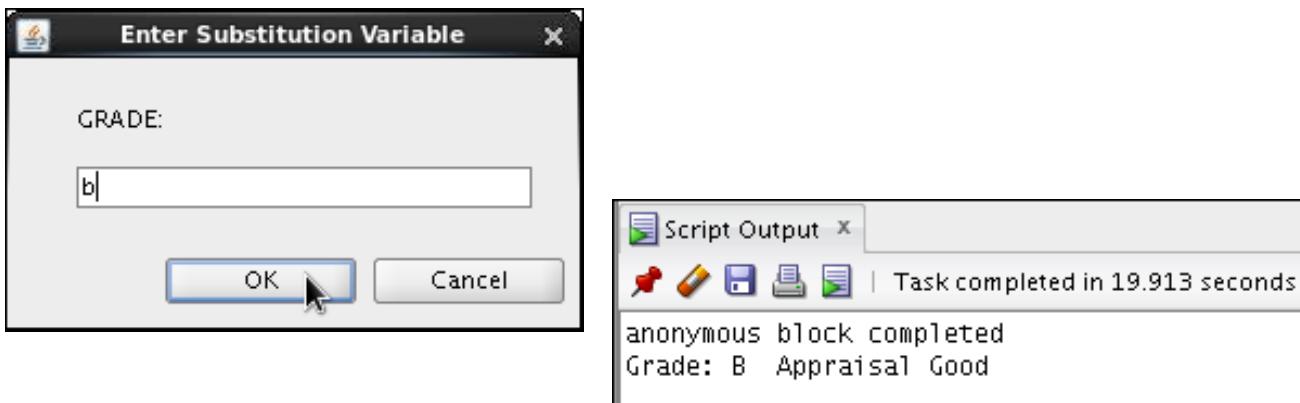

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the previous example, you saw a single test expression, the `v_grade` variable. The `WHEN` clause compares a value against this test expression.

In searched `CASE` statements, you do not have a test expression. Instead, the `WHEN` clause contains an expression that results in a Boolean value. The same example is rewritten in this slide to show searched `CASE` statements.

Result

The output of the example is as follows when you enter `b` or `B` for `v_grade`:

CASE Statement

```

DECLARE
    v_deptid NUMBER;
    v_deptname VARCHAR2(20);
    v_emps NUMBER;
    v_mngid NUMBER:= 108;
BEGIN
    CASE v_mngid
        WHEN 108 THEN
            SELECT department_id, department_name
            INTO v_deptid, v_deptname FROM departments
            WHERE manager_id=108;
            SELECT count(*) INTO v_emps FROM employees
            WHERE department_id=v_deptid;
        WHEN 200 THEN
            ...
    END CASE;
    DBMS_OUTPUT.PUT_LINE ('You are working in the '|| v_deptname ||
    ' department. There are '||v_emps ||' employees in this
    department');
END;
/

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Recall the use of the `IF` statement. You may include n number of PL/SQL statements in the `THEN` clause and also in the `ELSE` clause. Similarly, you can include statements in the `CASE` statement, which is more readable compared to multiple `IF` and `ELSIF` statements.

How a `CASE Expression` Differs from a `CASE Statement`

A `CASE expression` evaluates the condition and returns a value, whereas a `CASE statement` evaluates the condition and performs an action. A `CASE statement` can be a complete PL/SQL block.

- `CASE statements` end with `END CASE;`
- `CASE expressions` end with `END;`

The output of the slide code example is as follows:

Script Output X

Task completed in 0.003 seconds

anonymous block completed

You are working in the Finance department. There are 6 employees in this department

Note: Whereas an `IF` statement is able to do nothing (the conditions could be all false and the `ELSE` clause is not mandatory), a `CASE statement` must execute some PL/SQL statement.

Handling Nulls

When you are working with nulls, you can avoid some common mistakes by keeping in mind the following rules:

- Simple comparisons involving nulls always yield NULL.
- Applying the logical operator NOT to a null yields NULL.
- If the condition yields NULL in conditional control statements, its associated sequence of statements is not executed.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Consider the following example:

```
x := 5;  
y := NULL;  
...  
IF x != y THEN -- yields NULL, not TRUE  
    -- sequence_of_statements that are not executed  
END IF;
```

You may expect the sequence of statements to execute because `x` and `y` seem unequal. But nulls are indeterminate. Whether or not `x` is equal to `y` is unknown. Therefore, the `IF` condition yields NULL and the sequence of statements is bypassed.

```
a := NULL;  
b := NULL;  
...  
IF a = b THEN -- yields NULL, not TRUE  
    -- sequence_of_statements that are not executed  
END IF;
```

In the second example, you may expect the sequence of statements to execute because `a` and `b` seem equal. But, again, equality is unknown, so the `IF` condition yields NULL and the sequence of statements is bypassed.

Logic Tables

Build a simple Boolean condition with a comparison operator.

AND	<i>TRUE</i>	<i>FALSE</i>	<i>NULL</i>	OR	<i>TRUE</i>	<i>FALSE</i>	<i>NULL</i>	NOT	
<i>TRUE</i>	TRUE	FALSE	NULL	<i>TRUE</i>	TRUE	TRUE	TRUE	<i>TRUE</i>	FALSE
<i>FALSE</i>	FALSE	FALSE	FALSE	<i>FALSE</i>	TRUE	FALSE	NULL	<i>FALSE</i>	TRUE
<i>NULL</i>	NULL	FALSE	NULL	<i>NULL</i>	TRUE	NULL	NULL	<i>NULL</i>	NULL

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can build a simple Boolean condition by combining number, character, and date expressions with comparison operators.

You can build a complex Boolean condition by combining simple Boolean conditions with the logical operators AND, OR, and NOT. The logical operators are used to check the Boolean variable values and return TRUE, FALSE, or NULL. In the logic tables shown in the slide:

- FALSE takes precedence in an AND condition, and TRUE takes precedence in an OR condition
- AND returns TRUE only if both of its operands are TRUE
- OR returns FALSE only if both of its operands are FALSE
- NULL AND TRUE always evaluates to NULL because it is not known whether the second operand evaluates to TRUE

Note: The negation of NULL (NOT NULL) results in a null value because null values are indeterminate.

Boolean Expressions or Logical Expression?

What is the value of flag in each case?

```
flag := reorder_flag AND available_flag;
```

REORDER_FLAG	AVAILABLE_FLAG	FLAG
TRUE	TRUE	? (1)
TRUE	FALSE	? (2)
NULL	TRUE	? (3)
NULL	FALSE	? (4)

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The AND logic table can help you to evaluate the possibilities for the Boolean condition in the slide.

Answers

1. TRUE
2. FALSE
3. NULL
4. FALSE

Agenda

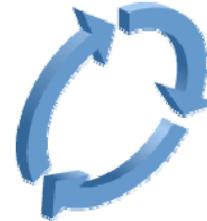

- Using IF statements
- Using CASE statements and CASE expressions
- Constructing and identifying loop statements

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Iterative Control: LOOP Statements

- Loops repeat a statement (or a sequence of statements) multiple times.
- There are three loop types:
 - Basic loop
 - FOR loop
 - WHILE loop

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL provides several facilities to structure loops to repeat a statement or sequence of statements multiple times. Loops are mainly used to execute statements repeatedly until an exit condition is reached. It is mandatory to have an exit condition in a loop; otherwise, the loop is infinite.

Looping constructs are the third type of control structures. PL/SQL provides the following types of loops:

- Basic loop that performs repetitive actions without overall conditions
- FOR loops that perform iterative actions based on a count
- WHILE loops that perform iterative actions based on a condition

Note: An `EXIT` statement can be used to terminate loops. A basic loop must have an `EXIT`. The cursor FOR loop (which is another type of FOR loop) is discussed in the lesson titled “Using Explicit Cursors.”

Basic Loops

Syntax:

```
LOOP
  statement1;
  . .
  EXIT [WHEN condition];
END LOOP;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The simplest form of a `LOOP` statement is the basic loop, which encloses a sequence of statements between the `LOOP` and `END LOOP` keywords. Each time the flow of execution reaches the `END LOOP` statement, control is returned to the corresponding `LOOP` statement above it. A basic loop allows execution of its statements at least once, even if the `EXIT` condition is already met upon entering the loop. Without the `EXIT` statement, the loop would be infinite.

EXIT Statement

You can use the `EXIT` statement to terminate a loop. Control passes to the next statement after the `END LOOP` statement. You can issue `EXIT` either as an action within an `IF` statement or as a stand-alone statement within the loop. The `EXIT` statement must be placed inside a loop. In the latter case, you can attach a `WHEN` clause to enable conditional termination of the loop. When the `EXIT` statement is encountered, the condition in the `WHEN` clause is evaluated. If the condition yields `TRUE`, the loop ends and control passes to the next statement after the loop.

A basic loop can contain multiple `EXIT` statements, but it is recommended that you have only one `EXIT` point.

Basic Loop: Example

```
DECLARE
    v_countryid      locations.country_id%TYPE := 'CA';
    v_loc_id          locations.location_id%TYPE;
    v_counter         NUMBER(2) := 1;
    v_new_city        locations.city%TYPE := 'Montreal';
BEGIN
    SELECT MAX(location_id) INTO v_loc_id FROM locations
    WHERE country_id = v_countryid;
    LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((v_loc_id + v_counter), v_new_city, v_countryid);
        v_counter := v_counter + 1;
        EXIT WHEN v_counter > 3;
    END LOOP;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The basic loop example shown in the slide is defined as follows: “Insert three new location IDs for the CA country code and the city of Montreal.”

Note

- A basic loop allows execution of its statements until the `EXIT WHEN` condition is met.
- If the condition is placed in the loop such that it is not checked until after the loop statements execute, the loop executes at least once.
- However, if the exit condition is placed at the top of the loop (before any of the other executable statements) and if that condition is true, the loop exits and the statements never execute.

Results

To view the output, run the code example under slide 22_sa in `code_ex_06.sql`.

WHILE Loops

Syntax:

```
WHILE condition LOOP  
  statement1;  
  statement2;  
  . . .  
END LOOP;
```

Use the WHILE loop to repeat statements while a condition is TRUE.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use the WHILE loop to repeat a sequence of statements until the controlling condition is no longer TRUE. The condition is evaluated at the start of each iteration. The loop terminates when the condition is FALSE or NULL. If the condition is FALSE or NULL at the start of the loop, no further iterations are performed. Thus, it is possible that none of the statements inside the loop are executed.

In the syntax:

condition Is a Boolean variable or expression (TRUE, FALSE, or NULL)

statement Can be one or more PL/SQL or SQL statements

If the variables involved in the conditions do not change during the body of the loop, the condition remains TRUE and the loop does not terminate.

Note: If the condition yields NULL, the loop is bypassed and control passes to the next statement.

WHILE Loops: Example

```
DECLARE
    v_countryid    locations.country_id%TYPE := 'CA';
    v_loc_id       locations.location_id%TYPE;
    v_new_city     locations.city%TYPE := 'Montreal';
    v_counter      NUMBER := 1;
BEGIN
    SELECT MAX(location_id) INTO v_loc_id FROM locations
    WHERE country_id = v_countryid;
    WHILE v_counter <= 3 LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((v_loc_id + v_counter), v_new_city, v_countryid);
        v_counter := v_counter + 1;
    END LOOP;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, three new location IDs for the CA country code and the city of Montreal are added.

- With each iteration through the WHILE loop, a counter (`v_counter`) is incremented.
- If the number of iterations is less than or equal to the number 3, the code within the loop is executed and a row is inserted into the `locations` table.
- After `v_counter` exceeds the number of new locations for this city and country, the condition that controls the loop evaluates to FALSE and the loop terminates.

Results

To view the output, run the code example under slide 24_sa in `code_ex_06.sql`.

FOR Loops

- Use a FOR loop to shortcut the test for the number of iterations.
- Do not declare the counter; it is declared implicitly.

```
FOR counter IN [REVERSE]
  lower_bound..upper_bound LOOP
    statement1;
    statement2;
    . . .
  END LOOP;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

FOR loops have the same general structure as the basic loop. In addition, they have a control statement before the LOOP keyword to set the number of iterations that the PL/SQL performs.

In the syntax:

<i>counter</i>	Is an implicitly declared integer whose value automatically increases or decreases (decreases if the REVERSE keyword is used) by 1 on each iteration of the loop until the upper or lower bound is reached
REVERSE	Causes the counter to decrement with each iteration from the upper bound to the lower bound Note: The lower bound is still referenced first.
<i>lower_bound</i>	Specifies the lower bound for the range of counter values
<i>upper_bound</i>	Specifies the upper bound for the range of counter values

Do not declare the counter. It is declared implicitly as an integer.

Note: The sequence of statements is executed each time the counter is incremented, as determined by the two bounds. The lower bound and upper bound of the loop range can be literals, variables, or expressions, but they must evaluate to integers. The bounds are rounded to integers; that is, $11/3$ and $8/5$ are valid upper or lower bounds. The lower bound and upper bound are inclusive in the loop range. If the lower bound of the loop range evaluates to a larger integer than the upper bound, the sequence of statements is not executed.

For example, the following statement is executed only once:

```
FOR i IN 3..3
LOOP
    statement1;
END LOOP;
```

FOR Loops: Example

```
DECLARE
    v_countryid    locations.country_id%TYPE := 'CA';
    v_loc_id       locations.location_id%TYPE;
    v_new_city     locations.city%TYPE := 'Montreal';
BEGIN
    SELECT MAX(location_id) INTO v_loc_id
        FROM locations
        WHERE country_id = v_countryid;
    FOR i IN 1..3 LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((v_loc_id + i), v_new_city, v_countryid );
    END LOOP;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have already learned how to insert three new locations for the CA country code and the city of Montreal by using the basic loop and the WHILE loop. The example in this slide shows how to achieve the same by using the FOR loop.

Results

To view the output, run the code example under slide 27_sa in code_ex_06.sql.

FOR Loop Rules

- Reference the counter only within the loop; it is undefined outside the loop.
- Do not reference the counter as the target of an assignment.
- Neither loop bound should be NULL.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide lists the guidelines to follow when writing a FOR loop.

Note: The lower and upper bounds of a LOOP statement do not need to be numeric literals. They can be expressions that convert to numeric values.

Example:

```
DECLARE
    v_lower  NUMBER := 1;
    v_upper  NUMBER := 100;
BEGIN
    FOR i IN v_lower..v_upper LOOP
        ...
    END LOOP;
END;
/
```

Suggested Use of Loops

- Use the basic loop when the statements inside the loop must execute at least once.
- Use the WHILE loop if the condition must be evaluated at the start of each iteration.
- Use a FOR loop if the number of iterations is known.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A basic loop allows the execution of its statement at least once, even if the condition is already met upon entering the loop. Without the EXIT statement, the loop would be infinite.

You can use the WHILE loop to repeat a sequence of statements until the controlling condition is no longer TRUE. The condition is evaluated at the start of each iteration. The loop terminates when the condition is FALSE. If the condition is FALSE at the start of the loop, no further iterations are performed.

FOR loops have a control statement before the LOOP keyword to determine the number of iterations that the PL/SQL performs. Use a FOR loop if the number of iterations is predetermined.

Nested Loops and Labels

- You can nest loops to multiple levels.
- Use labels to distinguish between blocks and loops.
- Exit the outer loop with the `EXIT` statement that references the label.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can nest the `FOR`, `WHILE`, and basic loops within one another. The termination of a nested loop does not terminate the enclosing loop unless an exception is raised. However, you can label loops and exit the outer loop with the `EXIT` statement.

Label names follow the same rules as the other identifiers. A label is placed before a statement, either on the same line or on a separate line. White space is insignificant in all PL/SQL parsing except inside literals. Label basic loops by placing the label before the word `LOOP` within label delimiters (`<<label>>`). In `FOR` and `WHILE` loops, place the label before `FOR` or `WHILE`.

If the loop is labeled, the label name can be included (optionally) after the `END LOOP` statement for clarity.

Nested Loops and Labels: Example

```
...
BEGIN
  <<Outer_loop>>
  LOOP
    v_counter := v_counter+1;
    EXIT WHEN v_counter>10;
    <<Inner_loop>>
    LOOP
      ...
      EXIT Outer_loop WHEN total_done = 'YES';
      -- Leave both loops
      EXIT WHEN inner_done = 'YES';
      -- Leave inner loop only
      ...
    END LOOP Inner_loop;
    ...
  END LOOP Outer_loop;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, there are two loops. The outer loop is identified by the label <<Outer_Loop>> and the inner loop is identified by the label <<Inner_Loop>>. The identifiers are placed before the word LOOP within label delimiters (<<label>>). The inner loop is nested within the outer loop. The label names are included after the END LOOP statements for clarity.

PL/SQL CONTINUE Statement

- Definition
 - Adds the functionality to begin the next loop iteration
 - Provides programmers with the ability to transfer control to the next iteration of a loop
 - Uses parallel structure and semantics to the EXIT statement
- Benefits
 - Eases the programming process
 - May provide a small performance improvement over the previous programming workarounds to simulate the CONTINUE statement

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The CONTINUE statement enables you to transfer control within a loop back to a new iteration or to leave the loop. Many other programming languages have this functionality. With the Oracle Database 11g release, PL/SQL also offers this functionality. Before the Oracle Database 11g release, you could code a workaround by using Boolean variables and conditional statements to simulate the CONTINUE programmatic functionality. In some cases, the workarounds are less efficient.

The CONTINUE statement offers you a simplified means to control loop iterations. It may be more efficient than the previous coding workarounds.

The CONTINUE statement is commonly used to filter data within a loop body before the main processing begins.

PL/SQL CONTINUE Statement: Example 1

```
DECLARE
    v_total SIMPLE_INTEGER := 0;
BEGIN
    FOR i IN 1..10 LOOP
        1 v_total := v_total + i;
        dbms_output.put_line
            ('Total is: '|| v_total);
        CONTINUE WHEN i > 5;
        2 v_total := v_total + i;
        dbms_output.put_line
            ('Out of Loop Total is:
             '|| v_total);
    END LOOP;
END;
/
```

```
Script Output X | Task compl
anonymous block completed
Total is: 1
Out of Loop Total is:
2
Total is: 4
Out of Loop Total is:
6
Total is: 9
Out of Loop Total is:
12
Total is: 16
Out of Loop Total is:
20
Total is: 25
Out of Loop Total is:
30
Total is: 36
Total is: 43
Total is: 51
Total is: 60
Total is: 70
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example, there are two assignments using the `v_total` variable:

1. The first assignment is executed for each of the 10 iterations of the loop.
2. The second assignment is executed for the first five iterations of the loop. The `CONTINUE` statement transfers control within a loop back to a new iteration, so for the last five iterations of the loop, the second `TOTAL` assignment is not executed.

The end result of the `TOTAL` variable is 70.

PL/SQL CONTINUE Statement: Example 2

```
DECLARE
  v_total NUMBER := 0;
BEGIN
  <<BeforeTopLoop>>
  FOR i IN 1..10 LOOP
    v_total := v_total + 1;
    dbms_output.put_line
      ('Total is: ' || v_total);
    FOR j IN 1..10 LOOP
      CONTINUE BeforeTopLoop WHEN i + j > 5;
      v_total := v_total + 1;
    END LOOP;
  END LOOP BeforeTopLoop;
END;
```

```
Script Output X | Task completed
anonymous block completed
Total is: 1
Total is: 6
Total is: 10
Total is: 13
Total is: 15
Total is: 16
Total is: 17
Total is: 18
Total is: 19
Total is: 20
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use the `CONTINUE` statement to jump to the next iteration of an outer loop.

To do this, provide the outer loop with a label to identify where the `CONTINUE` statement should go.

The `CONTINUE` statement in the innermost loop terminates that loop whenever the `WHEN` condition is true (just like the `EXIT` keyword). After the innermost loop is terminated by the `CONTINUE` statement, control transfers to the next iteration of the outermost loop labeled `BeforeTopLoop` in this example.

When this pair of loops completes, the value of the `TOTAL` variable is 20.

You can also use the `CONTINUE` statement within an inner block of code, which does not contain a loop as long as the block is nested inside an appropriate outer loop.

Restrictions

- The `CONTINUE` statement cannot appear outside a loop at all—this generates a compiler error.
- You cannot use the `CONTINUE` statement to pass through a procedure, function, or method boundary—this generates a compiler error.

Quiz

There are three types of loops: basic, FOR, and WHILE.

- a. True
- b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a

Loop Types

PL/SQL provides the following types of loops:

- Basic loops that perform repetitive actions without overall conditions
- FOR loops that perform iterative actions based on a count
- WHILE loops that perform iterative actions based on a condition

Summary

In this lesson, you should have learned to change the logical flow of statements by using the following control structures:

- Conditional (`IF` statement)
- `CASE` expressions and `CASE` statements
- Loops:
 - Basic loop
 - `FOR` loop
 - `WHILE` loop
- `EXIT` statement
- `CONTINUE` statement

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A language can be called a programming language only if it provides control structures for the implementation of business logic. These control structures are also used to control the flow of the program. PL/SQL is a programming language that integrates programming constructs with SQL.

A conditional control construct checks for the validity of a condition and performs an action accordingly. You use the `IF` construct to perform a conditional execution of statements.

An iterative control construct executes a sequence of statements repeatedly, as long as a specified condition holds `TRUE`. You use the various loop constructs to perform iterative operations.

Practice 6: Overview

This practice covers the following topics:

- Performing conditional actions by using `IF` statements
- Performing iterative steps by using `LOOP` structures

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this practice, you create the PL/SQL blocks that incorporate loops and conditional control structures. The exercises test your understanding of writing various `IF` statements and `LOOP` constructs.

Working with Composite Data Types

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Describe PL/SQL collections and records
- Create user-defined PL/SQL records
- Create a PL/SQL record with the %ROWTYPE attribute
- Create associative arrays
 - INDEX BY table
 - INDEX BY table of records

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have already been introduced to composite data types. In this lesson, you learn more about composite data types and their uses.

Agenda

- Introducing composite data types
- Using PL/SQL records
 - Manipulating data with PL/SQL records
 - Advantages of the %ROWTYPE attribute
- Using PL/SQL collections
 - Examining associative arrays
 - Introducing nested tables
 - Introducing VARRAY

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Composite Data Types

- Can hold multiple values (unlike scalar types)
- Are of two types:
 - PL/SQL records
 - PL/SQL collections
 - Associative array (INDEX BY table)
 - Nested table
 - VARRAY

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned that variables of the scalar data type can hold only one value, whereas variables of the composite data type can hold multiple values of the scalar data type or the composite data type. There are two types of composite data types:

- **PL/SQL records:** Records are used to treat related but dissimilar data as a logical unit. A PL/SQL record can have variables of different types. For example, you can define a record to hold employee details. This involves storing an employee number as NUMBER, a first name and last name as VARCHAR2, and so on. By creating a record to store employee details, you create a logical collective unit. This makes data access and manipulation easier.
- **PL/SQL collections:** Collections are used to treat data as a single unit. Collections are of three types:
 - Associative array
 - Nested table
 - VARRAY

Why Use Composite Data Types?

You have all the related data as a single unit. You can easily access and modify data. Data is easier to manage, relate, and transport if it is composite. An analogy is having a single bag for all your laptop components rather than a separate bag for each component.

PL/SQL Records or Collections?

- Use PL/SQL records when you want to store values of different data types but only one occurrence at a time.
- Use PL/SQL collections when you want to store values of the same data type.

PL/SQL Record:

TRUE	23-DEC-98	ATLANTA	
------	-----------	---------	---

PL/SQL Collection:

1	SMITH
2	JONES
3	BENNETT
4	KRAMER

PLS_INTEGER

VARCHAR2

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

If both PL/SQL records and PL/SQL collections are composite types, how do you choose which one to use?

- Use PL/SQL records when you want to store values of different data types that are logically related. For example, you can create a PL/SQL record to hold employee details and indicate that all the values stored are related because they provide information about a particular employee.
- Use PL/SQL collections when you want to store values of the same data type. Note that this data type can also be of the composite type (such as records). You can define a collection to hold the first names of all employees. You may have stored n names in the collection; however, name 1 is not related to name 2. The relation between these names is only that they are employee names. These collections are similar to arrays in programming languages such as C, C++, and Java.

Agenda

- Examining composite data types
- Using PL/SQL records
 - Manipulating data with PL/SQL records
 - Advantages of the %ROWTYPE attribute
- Using PL/SQL collections
 - Examining associative arrays
 - Introducing nested tables
 - Introducing VARRAY

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL Records

- Must contain one or more components (called *fields*) of any scalar, RECORD, or INDEX BY table data type
- Are similar to structures in most third-generation languages (including C and C++)
- Are user-defined and can be a subset of a row in a table
- Treat a collection of fields as a logical unit
- Are convenient for fetching a row of data from a table for processing

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A record is a group of related data items stored in fields, each with its own name and data type.

- Each record defined can have as many fields as necessary.
- Records can be assigned initial values and can be defined as NOT NULL.
- Fields without initial values are initialized to NULL.
- The DEFAULT keyword as well as := can be used in initializing fields.
- You can define RECORD types and declare user-defined records in the declarative part of any block, subprogram, or package.
- You can declare and reference nested records. One record can be the component of another record.

Creating a PL/SQL Record

Syntax:

1

```
TYPE type_name IS RECORD  
  (field_declaration[, field_declaration]...);
```

2

```
identifier type_name;
```

field_declaration:

```
field_name {field_type | variable%TYPE  
           | table.column%TYPE | table%ROWTYPE}  
           [ [NOT NULL] { := | DEFAULT} expr]
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL records are user-defined composite types. To use them, perform the following steps:

1. Define the record in the declarative section of a PL/SQL block. The syntax for defining the record is shown in the slide.
2. Declare (and optionally initialize) the internal components of this record type.

In the syntax:

type_name Is the name of the RECORD type (This identifier is used to declare records.)

field_name Is the name of a field within the record

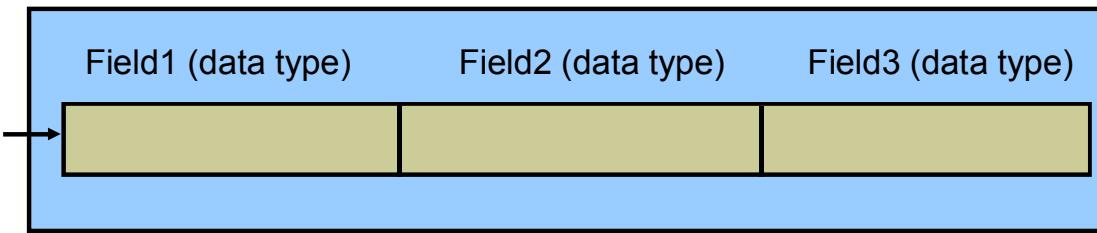

field_type Is the data type of the field (It represents any PL/SQL data type except REF CURSOR. You can use the %TYPE and %ROWTYPE attributes.)

expr Is the initial value

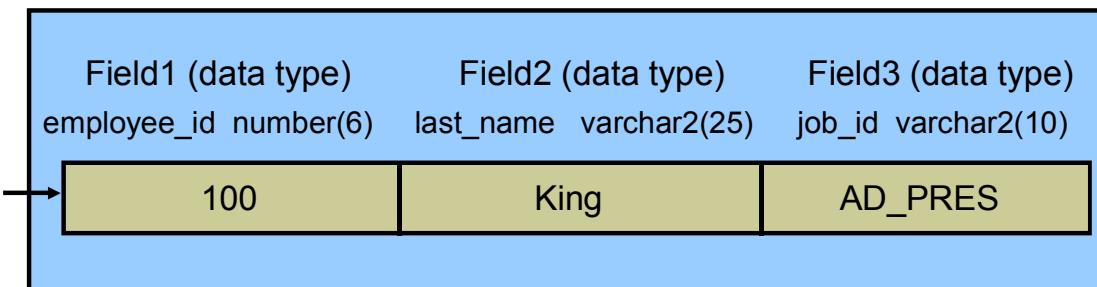

The NOT NULL constraint prevents assigning of nulls to the specified fields. Be sure to initialize the NOT NULL fields.

PL/SQL Record Structure

Field declarations:

Example:

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Fields in a record are accessed with the name of the record. To reference or initialize an individual field, use the dot notation:

```
record_name.field_name
```

For example, you reference the `job_id` field in the `emp_record` record as follows:

```
emp_record.job_id
```

You can then assign a value to the record field:

```
emp_record.job_id := 'ST_CLERK';
```

In a block or subprogram, user-defined records are instantiated when you enter the block or subprogram. They cease to exist when you exit the block or subprogram.

%ROWTYPE Attribute

- Declare a variable according to a collection of columns in a database table or view.
- Prefix %ROWTYPE with the database table or view.
- Fields in the record take their names and data types from the columns of the table or view.

Syntax:

```
DECLARE  
    identifier reference%ROWTYPE;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned that %TYPE is used to declare a variable of the column type. The variable has the same data type and size as the table column. The benefit of %TYPE is that you do not have to change the variable if the column is altered. Also, if the variable is a number and is used in any calculations, you need not worry about its precision.

The %ROWTYPE attribute is used to declare a record that can hold an entire row of a table or view. The fields in the record take their names and data types from the columns of the table or view. The record can also store an entire row of data fetched from a cursor or cursor variable.

The slide shows the syntax for declaring a record. In the syntax:

identifier Is the name chosen for the record as a whole

reference Is the name of the table, view, cursor, or cursor variable on which the record is to be based (The table or view must exist for this reference to be valid.)

In the following example, a record is declared using %ROWTYPE as a data type specifier:

```
DECLARE  
    emp_record employees%ROWTYPE;  
    ...
```

The `emp_record` record has a structure consisting of the following fields, each representing a column in the `employees` table.

Note: This is not code, but simply the structure of the composite variable.

```
(employee_id      NUMBER(6),
 first_name       VARCHAR2(20),
 last_name        VARCHAR2(20),
 email            VARCHAR2(20),
 phone_number     VARCHAR2(20),
 hire_date        DATE,
 job_id           VARCHAR2(10),
 salary            NUMBER(8,2),
 commission_pct   NUMBER(2,2),
 manager_id       NUMBER(6),
 department_id    NUMBER(4))
```

To reference an individual field, use the dot notation:

```
record_name.field_name
```

For example, you reference the `commission_pct` field in the `emp_record` record as follows:

```
emp_record.commission_pct
```

You can then assign a value to the record field:

```
emp_record.commission_pct := .35;
```

Assigning Values to Records

You can assign a list of common values to a record by using the `SELECT` or `FETCH` statement. Make sure that the column names appear in the same order as the fields in your record. You can also assign one record to another if both have the same corresponding data types. A record of type `employees%ROWTYPE` and a user-defined record type having analogous fields of the `employees` table will have the same data type. Therefore, if a user-defined record contains fields similar to the fields of a `%ROWTYPE` record, you can assign that user-defined record to the `%ROWTYPE` record.

Creating a PL/SQL Record: Example

```
DECLARE
  TYPE t_rec IS RECORD
    (v_sal number(8),
     v_minsal number(8) default 1000,
     v_hire_date employees.hire_date%type,
     v_rec1 employees%rowtype);
  v_myrec t_rec;
BEGIN
  v_myrec.v_sal := v_myrec.v_minsal + 500;
  v_myrec.v_hire_date := sysdate;
  SELECT * INTO v_myrec.v_rec1
    FROM employees WHERE employee_id = 100;
  DBMS_OUTPUT.PUT_LINE(v_myrec.v_rec1.last_name || ' ' ||
    to_char(v_myrec.v_hire_date) || ' ' || to_char(v_myrec.v_sal));
END;
```

```
anonymous block completed
King 16-OCT-12 1500
```

The field declarations used in defining a record are like variable declarations. Each field has a unique name and a specific data type. There are no predefined data types for PL/SQL records, as there are for scalar variables. Therefore, you must create the record type first, and then declare an identifier using that type.

In the example in the slide, a PL/SQL record is created using the required two-step process:

1. A record type (`t_rec`) is defined.
2. A record (`v_myrec`) of the `t_rec` type is declared.

Note

- The record contains four fields: `v_sal`, `v_minsal`, `v_hire_date`, and `v_rec1`.
- `v_rec1` is defined using the `%ROWTYPE` attribute, which is similar to the `%TYPE` attribute. With `%TYPE`, a field inherits the data type of a specified column. With `%ROWTYPE`, a field inherits the column names and data types of all columns in the referenced table.
- PL/SQL record fields are referenced using the `<record>. <field>` notation, or the `<record>. <field>. <column>` notation for fields that are defined with the `%ROWTYPE` attribute.
- You can add the `NOT NULL` constraint to any field declaration to prevent assigning nulls to that field. Remember that fields that are declared as `NOT NULL` must be initialized.

Advantages of Using the %ROWTYPE Attribute

- The number and data types of the underlying database columns need not be known—and, in fact, might change at run time.
- The %ROWTYPE attribute is useful when you want to retrieve a row with:
 - The SELECT * statement
 - Row-level INSERT and UPDATE statements

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The advantages of using the %ROWTYPE attribute are listed in the slide. Use the %ROWTYPE attribute when you are not sure about the structure of the underlying database table.

The main advantage of using %ROWTYPE is that it simplifies maintenance. Using %ROWTYPE ensures that the data types of the variables declared with this attribute change dynamically when the underlying table is altered. If a DDL statement changes the columns in a table, the PL/SQL program unit is invalidated. When the program is recompiled, it automatically reflects the new table format.

The %ROWTYPE attribute is particularly useful when you want to retrieve an entire row from a table. In the absence of this attribute, you would be forced to declare a variable for each of the columns retrieved by the SELECT statement.

Another %ROWTYPE Attribute Example

```

DECLARE
    v_employee_number number:= 124;
    v_emp_rec    employees%ROWTYPE;
BEGIN
    SELECT * INTO v_emp_rec FROM employees
    WHERE employee_id = v_employee_number;
    INSERT INTO retired_emps(empno, ename, job, mgr,
                           hiredate, leavedate, sal, comm, deptno)
    VALUES (v_emp_rec.employee_id, v_emp_rec.last_name,
            v_emp_rec.job_id, v_emp_rec.manager_id,
            v_emp_rec.hire_date, SYSDATE,
            v_emp_rec.salary, v_emp_rec.commission_pct,
            v_emp_rec.department_id);
END;
/

```

The screenshot shows a PL/SQL code block in the top pane and its execution results in the bottom pane.

PL/SQL Code:

```

SELECT * FROM retired_emps;

```

Execution Results:

	EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
1	124	Mourgos	ST_MAN	100	16-NOV-07	16-OCT-12	5800	(null)	50

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Another example of the %ROWTYPE attribute is shown in the slide. If an employee is retiring, information about that employee is added to a table that holds information about retired employees. The user supplies the employee number. The record of the employee specified by the user is retrieved from the employees table and stored in the emp_rec variable, which is declared using the %ROWTYPE attribute.

The CREATE statement that creates the `retired_emps` table is:

```

CREATE TABLE retired_emps
(
    EMPNO      NUMBER(4), ENAME      VARCHAR2(10),
    JOB        VARCHAR2(9), MGR       NUMBER(4),
    HIREDATE   DATE, LEAVEDATE   DATE,
    SAL        NUMBER(7,2), COMM      NUMBER(7,2),
    DEPTNO     NUMBER(2)
)

```

Note

- The record that is inserted into the `retired_emps` table is shown in the slide.
- To see the output shown in the slide, place your cursor on the `SELECT` statement at the bottom of the code example in SQL Developer and press F9.
- The complete code example is found under slide 14_s-n in `code_ex_07.sql`.

Inserting a Record by Using %ROWTYPE

```
...
DECLARE
    v_employee_number number:= 124;
    v_emp_rec retired_emps%ROWTYPE;
BEGIN
    SELECT employee_id, last_name, job_id, manager_id,
    hire_date, hire_date, salary, commission_pct,
    department_id INTO v_emp_rec FROM employees
    WHERE employee_id = v_employee_number;
    INSERT INTO retired_emps VALUES v_emp_rec;
END;
/
SELECT * FROM retired_emps;
```

The screenshot shows the Oracle SQL Developer interface. A query window titled "Query Result" displays the output of the executed PL/SQL code. The output shows one row inserted into the "retired_emps" table. The columns are labeled: EMPNO, ENAME, JOB, MGR, HIREDATE, LEAVEDATE, SAL, COMM, DEPTNO. The values for the inserted row are: 124, Mourgos, ST_MAN, 100, 16-NOV-07, 16-NOV-07, 5800, (null), 50.

EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
124	Mourgos	ST_MAN	100	16-NOV-07	16-NOV-07	5800	(null)	50

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Compare the `INSERT` statement in the previous slide with the `INSERT` statement in this slide. The `emp_rec` record is of type `retired_emps`. The number of fields in the record must be equal to the number of field names in the `INTO` clause. You can use this record to insert values into a table. This makes the code more readable.

Examine the `SELECT` statement in the slide. You select `hire_date` twice and insert the `hire_date` value in the `leavedate` field of `retired_emps`. No employee retires on the hire date. The inserted record is shown in the slide. (You will see how to update this in the next slide.)

Note: To see the output shown in the slide, place your cursor on the `SELECT` statement at the bottom of the code example in SQL Developer and press F9.

Updating a Row in a Table by Using a Record

```
DECLARE
    v_employee_number number:= 124;
    v_emp_rec    retired_emps%ROWTYPE;
BEGIN
    SELECT * INTO v_emp_rec FROM retired_emps WHERE
        empno = v_employee_number;
    v_emp_rec.leavedate:= CURRENT_DATE;
    UPDATE retired_emps SET ROW = v_emp_rec WHERE
        empno=v_employee_number;
END;
/
SELECT * FROM retired_emps;
```

EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
1	124	Mourgos	ST_MAN	100	16-NOV-07	05-NOV-12	5800	(null)

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned to insert a row by using a record. This slide shows you how to update a row by using a record.

- The `ROW` keyword is used to represent the entire row.
- The code shown in the slide updates the `leavedate` of the employee.
- The record is updated as shown in the slide.

Note: To see the output shown in the slide, place your cursor on the `SELECT` statement at the bottom of the code example in SQL Developer and press F9.

Agenda

- Examining composite data types
- Using PL/SQL records
 - Manipulating data with PL/SQL records
 - Advantages of the %ROWTYPE attribute
- Using PL/SQL collections
 - Examining associative arrays
 - Introducing nested tables
 - Introducing VARRAY

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As stated previously, PL/SQL collections are used when you want to store values of the same data type. This data type can also be of the composite type (such as records).

Therefore, collections are used to treat data as a single unit. Collections are of three types:

- Associative array
- Nested table
- VARRAY

Note: Of these three collections, the associative array is the focus of this lesson. The Nested table and VARRAY are introduced only for comparative purposes. These two collections are covered in detail in the course titled *Oracle Database : Advanced PL/SQL*.

Associative Arrays (*INDEX BY* Tables)

An associative array is a PL/SQL collection with two columns:

- Primary key of integer or string data type
- Column of scalar or record data type

Key	Values
1	JONES
2	HARDEY
3	MADURO
4	KRAMER

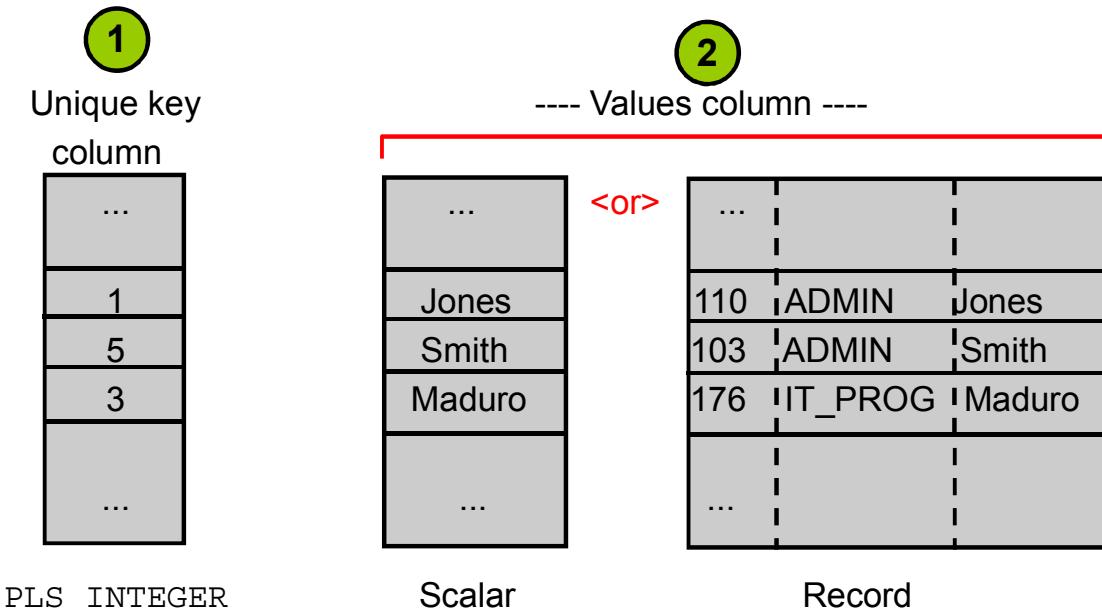

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An associative array is a type of PL/SQL collection. It is a composite data type, and is user-defined. Associative arrays are sets of key-value pairs. They can store data using a primary key value as the index, where the key values are not necessarily sequential. Associative arrays are also known as *INDEX BY* tables.

Associative arrays have only two columns, neither of which can be named:

- The first column, of integer or string type, acts as the primary key.
- The second column, of scalar or record data type, holds values.

Associative Array Structure

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As previously mentioned, associative arrays have two columns. The second column holds either one value per row or multiple values.

Unique Key Column: The data type of the key column can be:

- Numeric, either BINARY_INTEGER or PLS_INTEGER. These two numeric data types require less storage than NUMBER, and arithmetic operations on these data types are faster than the NUMBER arithmetic.
- VARCHAR2 or one of its subtypes

“Value” Column: The value column can be either a scalar data type or a record data type. A column with scalar data type can hold only one value per row, whereas a column with record data type can hold multiple values per row.

Other Characteristics

- An associative array is not populated at the time of declaration. It contains no keys or values, and you cannot initialize an associative array in its declaration.
- An explicit executable statement is required to populate the associative array.
- Like the size of a database table, the size of an associative array is unconstrained. That is, the number of rows can increase dynamically so that your associative array grows as new rows are added. Note that the keys do not have to be sequential, and can be both positive and negative.

Steps to Create an Associative Array

Syntax:

```

1 TYPE type_name IS TABLE OF
  { column_type [NOT NULL] | variable%TYPE [NOT NULL]
  | table.column%TYPE [NOT NULL]
  | table%ROWTYPE }
INDEX BY { PLS_INTEGER | BINARY_INTEGER
| VARCHAR2(<size>) } ;
2 identifier type_name;

```

Example:

```

...
TYPE ename_table_type IS TABLE OF
  employees.last_name%TYPE
INDEX BY PLS_INTEGER;
...
ename_table ename_table_type;

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

There are two steps involved in creating an associative array:

1. Declare a TABLE data type using the INDEX BY option.
2. Declare a variable of that data type.

Syntax

type_name Is the name of the TABLE type (This name is used in the subsequent declaration of the array identifier.)

column_type Is any scalar or composite data type such as VARCHAR2, DATE, NUMBER, or %TYPE (You can use the %TYPE attribute to provide the column data type.)

identifier Is the name of the identifier that represents an entire associative array

Note: The NOT NULL constraint prevents nulls from being assigned to the associative array.

Example

In the example, an associative array with the variable name ename_table is declared to store the last names of employees.

Creating and Accessing Associative Arrays

```

...
DECLARE
    TYPE ename_table_type IS TABLE OF
        employees.last_name%TYPE
        INDEX BY PLS_INTEGER;
    TYPE hiredate_table_type IS TABLE OF DATE
        INDEX BY PLS_INTEGER;
    ename_table      ename_table_type;
    hiredate_table   hiredate_table_type;
BEGIN
    ename_table(1)      := 'CAMERON';
    hiredate_table(8)   := SYSDATE + 7;
    IF ename_table.EXISTS(1) THEN
        INSERT INTO ...
    ...
END;
/
...

```

ENAME	HIREDT
CAMERON	23-OCT-12

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide creates two associative arrays, with the identifiers `ename_table` and `hiredate_table`.

The key of each associative array is used to access an element in the array, by using the following syntax:

identifier(index)

In both arrays, the `index` value belongs to the `PLS_INTEGER` type.

- To reference the first row in the `ename_table` associative array, specify:
`ename_table(1)`
- To reference the eighth row in the `hiredate_table` associative array, specify:
`hiredate_table(8)`

Note

- The magnitude range of a `PLS_INTEGER` is -2,147,483,647 through 2,147,483,647, so the primary key value can be negative. Indexing does not need to start with 1.
- The `exists (i)` method returns TRUE if a row with index *i* is returned. Use the `exists` method to prevent an error that is raised in reference to a nonexistent table element.
- The complete code example is found under slide 21_sa in `code_ex_07.sql`.

Using INDEX BY Table Methods

The following methods make associative arrays easier to use:

- EXISTS
- COUNT
- FIRST
- LAST
- PRIOR
- NEXT
- DELETE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An INDEX BY table method is a built-in procedure or function that operates on an associative array and is called by using the dot notation.

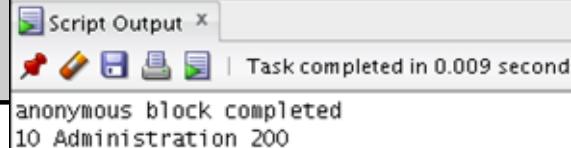

Syntax: `table_name.method_name [(parameters)]`

Method	Description
EXISTS (<i>n</i>)	Returns TRUE if the index <i>n</i> in an associative array exists
COUNT	Returns the number of elements that an associative array currently contains
FIRST	<ul style="list-style-type: none"> • Returns the first (smallest) index number in an associative array • Returns NULL if the associative array is empty
LAST	<ul style="list-style-type: none"> • Returns the last (largest) index number in an associative array • Returns NULL if the associative array is empty
PRIOR (<i>n</i>)	Returns the index number that precedes index <i>n</i> in an associative array
NEXT (<i>n</i>)	Returns the index number that succeeds index <i>n</i> in an associative array
DELETE	<ul style="list-style-type: none"> • DELETE removes all elements from an associative array. • DELETE (<i>n</i>) removes the index <i>n</i> from an associative array. • DELETE (<i>m</i>, <i>n</i>) removes all elements in the range <i>m</i> ... <i>n</i> from an associative array.

INDEX BY Table of Records Option

Define an associative array to hold an entire row from a table.

```
DECLARE
  TYPE dept_table_type
  IS
    TABLE OF departments%ROWTYPE INDEX BY VARCHAR2(20);
    dept_table dept_table_type;
    -- Each element of dept_table is a record
BEGIN
  SELECT * INTO dept_table(1) FROM departments
  WHERE department_id = 10;
  DBMS_OUTPUT.PUT_LINE(dept_table(1).department_id || ' ' ||
    dept_table(1).department_name || ' ' ||
    dept_table(1).manager_id);
END;
/
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As previously discussed, an associative array that is declared as a table of scalar data type can store the details of only one column in a database table. However, there is often a need to store all the columns retrieved by a query. The INDEX BY table of records option enables one array definition to hold information about all the fields of a database table.

Creating and Referencing a Table of Records

As shown in the associative array example in the slide, you can:

- Use the %ROWTYPE attribute to declare a record that represents a row in a database table
- Refer to fields within the `dept_table` array because each element of the array is a record

The differences between the %ROWTYPE attribute and the composite data type PL/SQL record are as follows:

- PL/SQL record types can be user-defined, whereas %ROWTYPE implicitly defines the record.
- PL/SQL records enable you to specify the fields and their data types while declaring them. When you use %ROWTYPE, you cannot specify the fields. The %ROWTYPE attribute represents a table row with all the fields based on the definition of that table.
- User-defined records are static, but %ROWTYPE records are dynamic—they are based on a table structure. If the table structure changes, the record structure also picks up the change.

INDEX BY Table of Records Option: Example 2

```
DECLARE
    TYPE emp_table_type IS TABLE OF
        employees%ROWTYPE INDEX BY PLS_INTEGER;
    my_emp_table  emp_table_type;
    max_count      NUMBER(3):= 104;
BEGIN
    FOR i IN 100..max_count
    LOOP
        SELECT * INTO my_emp_table(i) FROM employees
        WHERE employee_id = i;
    END LOOP;
    FOR i IN my_emp_table.FIRST..my_emp_table.LAST
    LOOP
        DBMS_OUTPUT.PUT_LINE(my_emp_table(i).last_name);
    END LOOP;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide declares an associative array, using the INDEX BY table of records option, to temporarily store the details of employees whose employee IDs are between 100 and 104. The variable name for the array is `emp_table_type`.

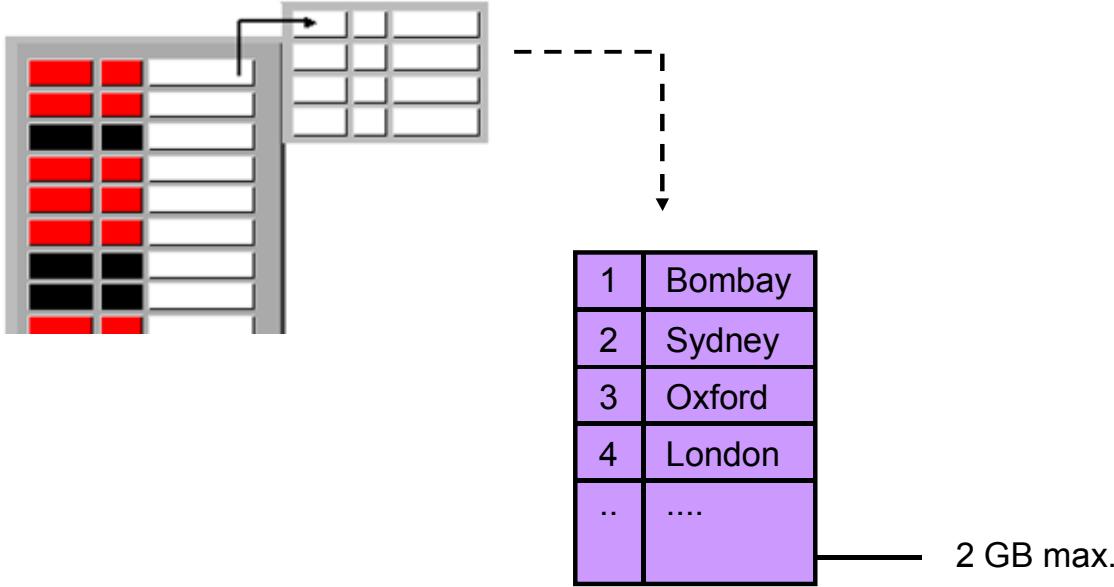

Using a loop, the information of the employees from the `EMPLOYEES` table is retrieved and stored in the array. Another loop is used to print the last names from the array. Note the use of the `first` and `last` methods in the example.

Note: The slide demonstrates one way to work with an associative array that uses the INDEX BY table of records method. However, you can do the same more efficiently using cursors. Cursors are explained in the lesson titled “Using Explicit Cursors.”

The results of the code example are as follows:

The screenshot shows the Oracle SQL Developer interface with the 'Script Output' tab selected. The output window displays the following text:
anonymous block completed
King
Kochhar
De Haan
Hunold
Ernst

Nested Tables

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The functionality of nested tables is similar to that of associative arrays; however, there are differences in the nested table implementation.

- The nested table is a valid data type in a schema-level table, but an associative array is not. Therefore, unlike associative arrays, nested tables can be stored in the database.
- The size of a nested table can increase dynamically, although the maximum size is 2 GB.
- The “key” cannot be a negative value (unlike in the associative array). Though reference is made to the first column as key, there is no key in a nested table. There is a column with numbers.
- Elements can be deleted from anywhere in a nested table, leaving a sparse table with nonsequential “keys.” The rows of a nested table are not in any particular order.
- When you retrieve values from a nested table, the rows are given consecutive subscripts starting from 1.

Syntax

```
TYPE type_name IS TABLE OF
  {column_type | variable%TYPE
  | table.column%TYPE} [NOT NULL]
  | table.%ROWTYPE
```

Example:

```
TYPE location_type IS TABLE OF locations.city%TYPE;
offices location_type;
```

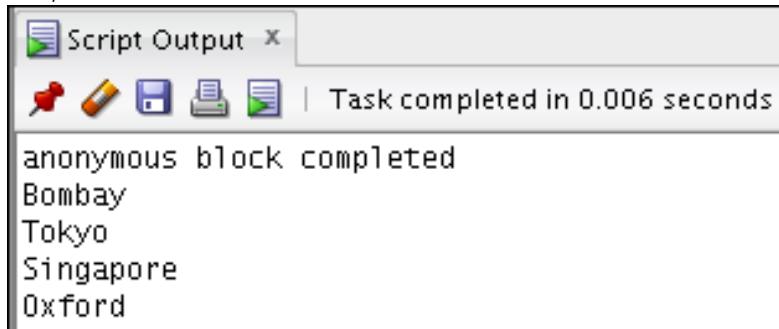

If you do not initialize a nested table, it is automatically initialized to NULL. You can initialize the `offices` nested table by using a constructor:

```
offices := location_type('Bombay', 'Tokyo', 'Singapore',
'Oxford');
```

The complete code example and output is as follows:

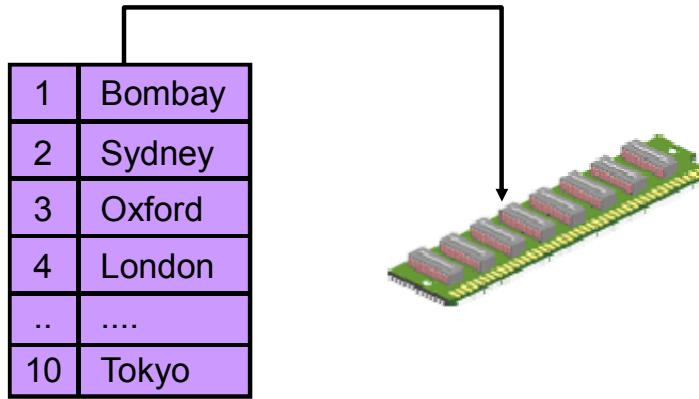

```
SET SERVEROUTPUT ON;

DECLARE
    TYPE location_type IS TABLE OF locations.city%TYPE;
    offices location_type;
    table_count NUMBER;
BEGIN
    offices := location_type('Bombay', 'Tokyo', 'Singapore',
        'Oxford');
    FOR i in 1.. offices.count() LOOP
        DBMS_OUTPUT.PUT_LINE(offices(i));
    END LOOP;
END;
/
```

```
Script Output x
Task completed in 0.006 seconds
anonymous block completed
Bombay
Tokyo
Singapore
Oxford
```

VARRAY

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A variable-size array (VARRAY) is similar to an associative array, except that a VARRAY is constrained in size.

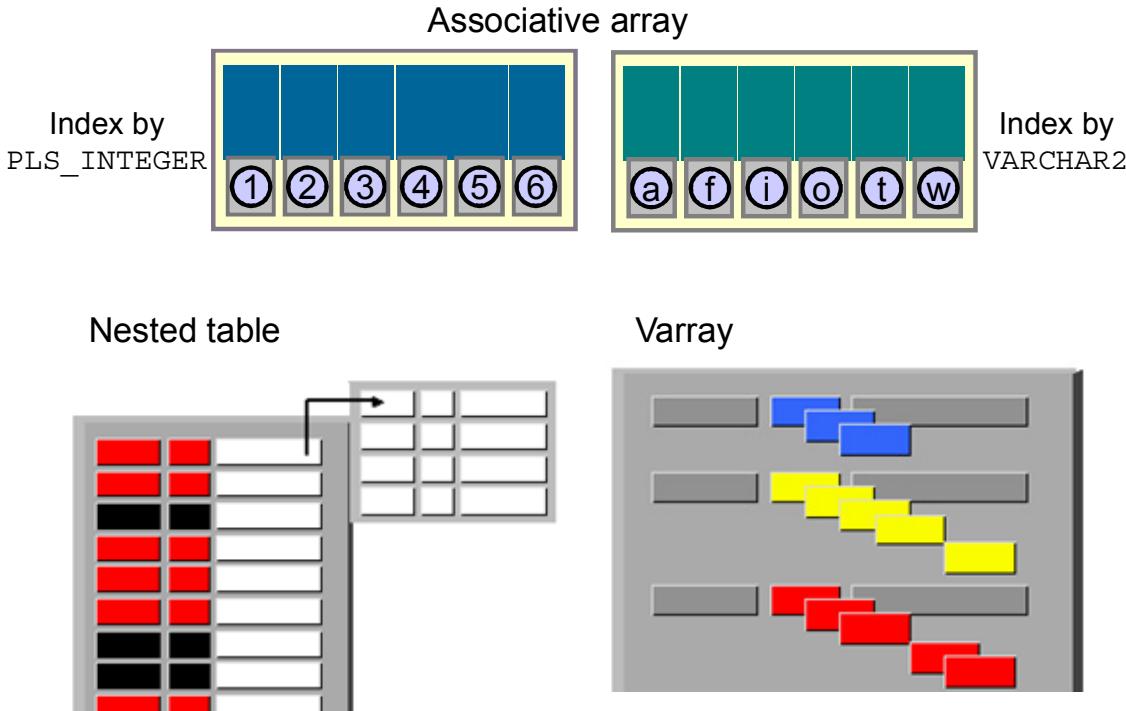

- A VARRAY is valid in a schema-level table.
- Items of VARRAY type are called VARRAYS.
- VARRAYS have a fixed upper bound. You have to specify the upper bound when you declare them. This is similar to arrays in C language. The maximum size of a VARRAY is 2 GB, as in nested tables.
- The distinction between a nested table and a VARRAY is the physical storage mode. The elements of a VARRAY are stored inline with the table's data unless the size of the VARRAY is greater than 4 KB. Contrast that with nested tables, which are always stored out-of-line.
- You can create a VARRAY type in the database by using SQL.

Example:

```
TYPE location_type IS VARRAY(3) OF locations.city%TYPE;
offices location_type;
```

The size of this VARRAY is restricted to 3. You can initialize a VARRAY by using constructors. If you try to initialize the VARRAY with more than three elements, a “Subscript outside of limit” error message is displayed.

Summary of Collection Types

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Associative Arrays

Associative arrays are sets of key-value pairs, where each key is unique and is used to locate a corresponding value in the array. The key can be either integer- or character-based. The array value may be of the scalar data type (single value) or the record data type (multiple values).

Because associative arrays are intended for storing temporary data, you cannot use them with SQL statements such as `INSERT` and `SELECT INTO`.

Nested Tables

A nested table holds a set of values. That is, it is a table within a table. Nested tables are unbounded; that is, the size of the table can increase dynamically. Nested tables are available in both PL/SQL and the database. Within PL/SQL, nested tables are like one-dimensional arrays whose size can increase dynamically.

Varrays

Variable-size arrays, or varrays, are also collections of homogeneous elements that hold a fixed number of elements (although you can change the number of elements at run time). They use sequential numbers as subscripts. You can define equivalent SQL types, thereby allowing varrays to be stored in database tables.

Quiz

Identify situations in which you can use the %ROWTYPE attribute.

- a. When you are not sure about the structure of the underlying database table
- b. When you want to retrieve an entire row from a table
- c. When you want to declare a variable according to another previously declared variable or database column

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a, b

Advantages of Using the %ROWTYPE Attribute

Use the %ROWTYPE attribute when you are not sure about the structure of the underlying database table.

The main advantage of using %ROWTYPE is that it simplifies maintenance. Using %ROWTYPE ensures that the data types of the variables declared with this attribute change dynamically when the underlying table is altered. If a DDL statement changes the columns in a table, the PL/SQL program unit is invalidated. When the program is recompiled, it automatically reflects the new table format.

The %ROWTYPE attribute is particularly useful when you want to retrieve an entire row from a table. In the absence of this attribute, you would be forced to declare a variable for each of the columns retrieved by the SELECT statement.

Summary

In this lesson, you should have learned to:

- Define and reference PL/SQL variables of composite data types
 - PL/SQL record
 - Associative array
 - INDEX BY table
 - INDEX BY table of records
- Define a PL/SQL record by using the %ROWTYPE attribute
- Compare and contrast the three PL/SQL collection types:
 - Associative array
 - Nested table
 - VARRAY

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A PL/SQL record is a collection of individual fields that represent a row in a table. By using records, you can group the data into one structure, and then manipulate this structure as one entity or logical unit. This helps reduce coding and keeps the code easy to maintain and understand.

Like PL/SQL records, a PL/SQL collection is another composite data type. PL/SQL collections include:

- **Associative arrays** (also known as INDEX BY tables): They are objects of TABLE type and look similar to database tables, but with a slight difference. The so-called INDEX BY tables use a primary key to give you array-like access to rows. The size of an associative array is unconstrained.
- **Nested tables**: The key for nested tables cannot have a negative value, unlike INDEX BY tables. The key must also be in a sequence.
- **Variable-size arrays** (VARRAY): A VARRAY is similar to associative arrays, except that a VARRAY is constrained in size.

Practice 7: Overview

This practice covers the following topics:

- Declaring associative arrays
- Processing data by using associative arrays
- Declaring a PL/SQL record
- Processing data by using a PL/SQL record

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this practice, you define, create, and use associative arrays and PL/SQL records.

Using Explicit Cursors

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Distinguish between implicit and explicit cursors
- Discuss the reasons for using explicit cursors
- Declare and control explicit cursors
- Use simple loops and cursor FOR loops to fetch data
- Declare and use cursors with parameters
- Lock rows with the FOR UPDATE clause
- Reference the current row with the WHERE CURRENT OF clause

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have learned about implicit cursors that are automatically created by PL/SQL when you execute a SQL SELECT or DML statement. In this lesson, you learn about explicit cursors. You learn to differentiate between implicit and explicit cursors. You also learn to declare and control simple cursors, as well as cursors with parameters.

Agenda

- What are explicit cursors?
- Using explicit cursors
- Using cursors with parameters
- Locking rows and referencing the current row

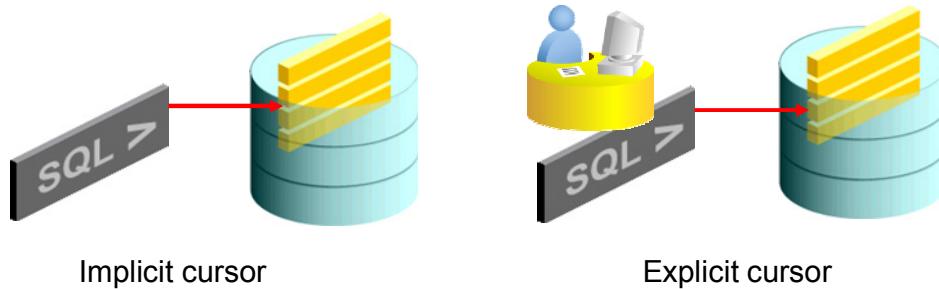

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Cursors

Every SQL statement that is executed by the Oracle Server has an associated individual cursor:

- Implicit cursors: Declared and managed by PL/SQL for all DML and PL/SQL SELECT statements
- Explicit cursors: Declared and managed by the programmer

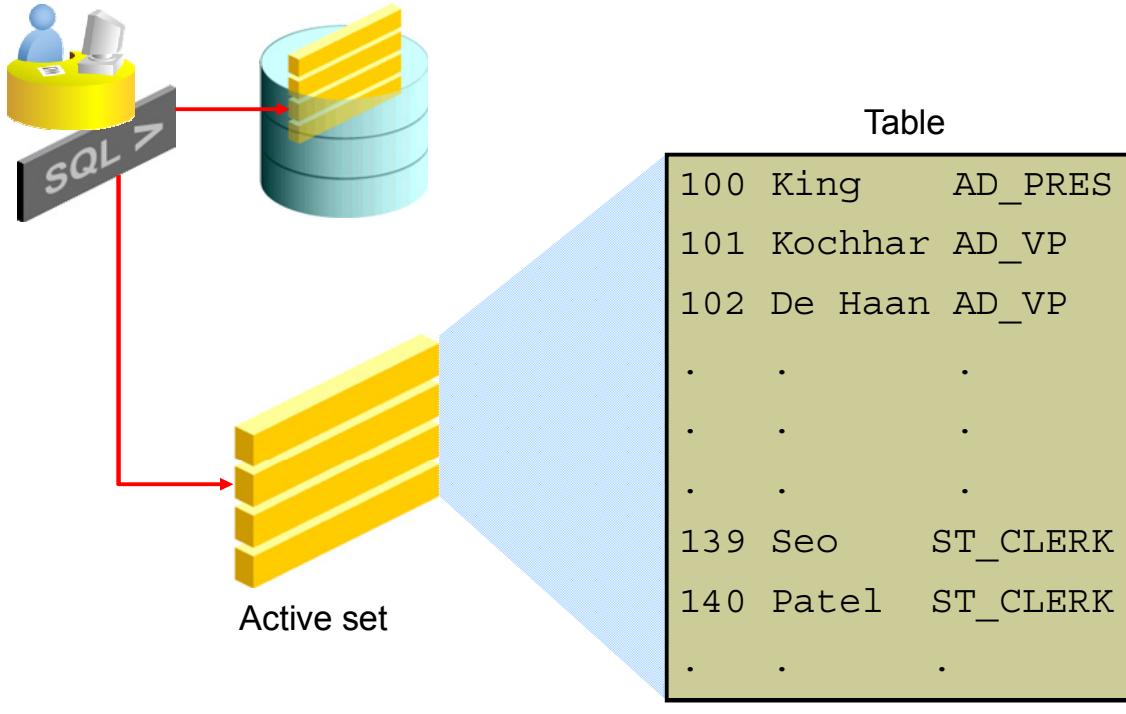

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The Oracle Server uses work areas (called *private SQL areas*) to execute SQL statements and to store processing information. You can use explicit cursors to name a private SQL area and to access its stored information.

Cursor Type	Description
Implicit	Implicit cursors are declared by PL/SQL implicitly for all DML and PL/SQL SELECT statements.
Explicit	For queries that return multiple rows, explicit cursors are declared and managed by the programmer, and manipulated through specific statements in the block's executable actions.

The Oracle Server implicitly opens a cursor to process each SQL statement that is not associated with an explicitly declared cursor. Using PL/SQL, you can refer to the most recent implicit cursor as the SQL cursor.

Explicit Cursor Operations

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

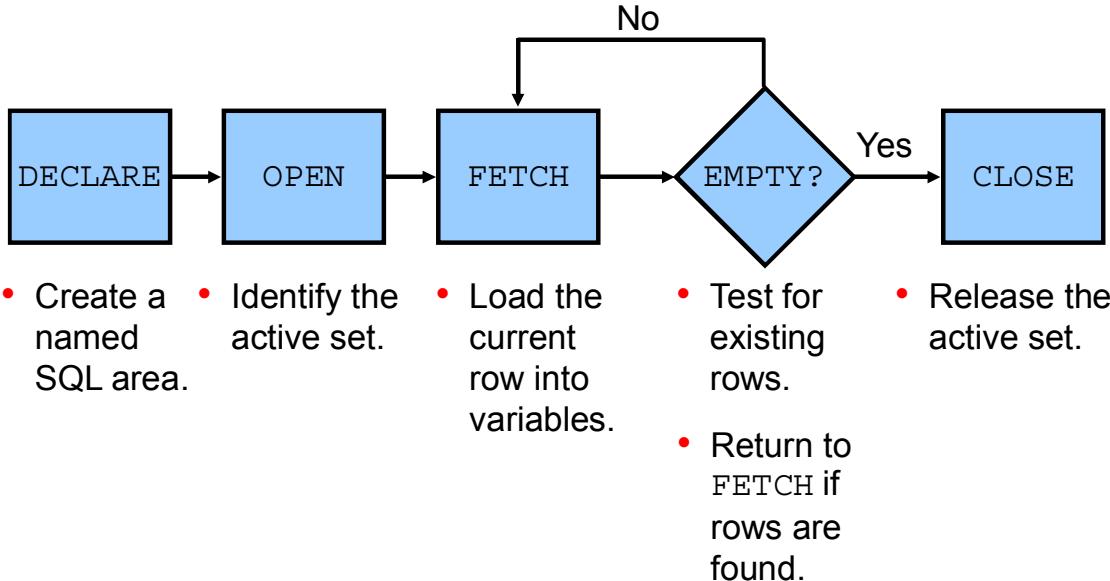

You declare explicit cursors in PL/SQL when you have a `SELECT` statement that returns multiple rows. You can process each row returned by the `SELECT` statement.

The set of rows returned by a multiple-row query is called the *active set*. Its size is the number of rows that meet your search criteria. The diagram in the slide shows how an explicit cursor “points” to the current row in the active set. This enables your program to process the rows one at a time.

Explicit cursor functions:

- Can perform row-by-row processing beyond the first row returned by a query
- Keep track of the row that is currently being processed
- Enable the programmer to manually control explicit cursors in the PL/SQL block

Controlling Explicit Cursors

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Now that you have a conceptual understanding of cursors, review the steps to use them.

1. In the declarative section of a PL/SQL block, declare the cursor by naming it and defining the structure of the query to be associated with it.
2. Open the cursor.
The **OPEN** statement executes the query, binds any variables that are referenced and positions the cursor at the first row. Rows identified by the query are called the *active set* and are now available for fetching.
3. Fetch data from the cursor.
In the flow diagram shown in the slide, after each fetch, you test the cursor for any existing row. If there are no more rows to process, you must close the cursor.
The **FETCH** statement retrieves the current row and advances the cursor to the next row until there are no more rows or a specified condition is met.
4. Close the cursor.
The **CLOSE** statement releases the active set of rows. It is now possible to reopen the cursor to establish a fresh active set.

Agenda

- What are explicit cursors?
- **Using explicit cursors**
- Using cursors with parameters
- Locking rows and referencing the current row

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Declaring the Cursor

Syntax:

```
CURSOR cursor_name IS  
    select_statement;
```

Examples:

```
DECLARE  
    CURSOR c_emp_cursor IS  
        SELECT employee_id, last_name FROM employees  
        WHERE department_id = 30;
```

```
DECLARE  
    v_locid NUMBER := 1700;  
    CURSOR c_dept_cursor IS  
        SELECT * FROM departments  
        WHERE location_id = v_locid;  
    ...
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The syntax to declare a cursor is shown in the slide. In the syntax:

- cursor_name* Is a PL/SQL identifier
select_statement Is a SELECT statement without an INTO clause

The active set of a cursor is determined by the SELECT statement in the cursor declaration. It is mandatory to have an INTO clause for a SELECT statement in PL/SQL. However, note that the SELECT statement in the cursor declaration cannot have an INTO clause. That is because you are only defining a cursor in the declarative section and not retrieving any rows into the cursor.

Note

- Do not include the INTO clause in the cursor declaration because it appears later in the FETCH statement.
- If you want the rows to be processed in a specific sequence, use the ORDER BY clause in the query.
- The cursor can be any valid SELECT statement, including joins, subqueries, and so on.

The `c_emp_cursor` cursor is declared to retrieve the `employee_id` and `last_name` columns for those employees working in the department with `department_id` 30.

The `c_dept_cursor` cursor is declared to retrieve all the details for the department with the `location_id` 1700. Note that a variable is used while declaring the cursor. These variables are considered bind variables, which must be visible when you are declaring the cursor. These variables are examined only once at the time the cursor opens. You have learned that explicit cursors are used when you have to retrieve and operate on multiple rows in PL/SQL. However, this example shows that you can use the explicit cursor even if your `SELECT` statement returns only one row.

Opening the Cursor

```
DECLARE
    CURSOR c_emp_cursor IS
        SELECT employee_id, last_name FROM employees
        WHERE department_id =30;
    ...
BEGIN
    OPEN c_emp_cursor;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The `OPEN` statement executes the query associated with the cursor, identifies the active set, and positions the cursor pointer at the first row. The `OPEN` statement is included in the executable section of the PL/SQL block.

`OPEN` is an executable statement that performs the following operations:

1. Dynamically allocates memory for a context area
2. Parses the `SELECT` statement
3. Binds the input variables (sets the values for the input variables by obtaining their memory addresses)
4. Identifies the active set (the set of rows that satisfy the search criteria). Rows in the active set are not retrieved into variables when the `OPEN` statement is executed. Rather, the `FETCH` statement retrieves the rows from the cursor to the variables.
5. Positions the pointer to the first row in the active set

Note: If a query returns no rows when the cursor is opened, PL/SQL does not raise an exception.

Fetching Data from the Cursor

```
DECLARE
  CURSOR c_emp_cursor IS
    SELECT employee_id, last_name FROM employees
    WHERE department_id =30;
    v_empno employees.employee_id%TYPE;
    v_lname employees.last_name%TYPE;
BEGIN
  OPEN c_emp_cursor;
  FETCH c_emp_cursor INTO v_empno, v_lname;
  DBMS_OUTPUT.PUT_LINE( v_empno || ' '||v_lname);
END;
/
```

```
anonymous block completed
114  Raphaely
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The `FETCH` statement retrieves the rows from the cursor one at a time. After each fetch, the cursor advances to the next row in the active set. You can use the `%NOTFOUND` attribute to determine whether the entire active set has been retrieved.

Consider the example shown in the slide. Two variables, `v_empno` and `v_lname`, are declared to hold the fetched values from the cursor. Examine the `FETCH` statement.

You have successfully fetched the values from the cursor to the variables. However, there are six employees in department 30, but only one row was fetched. To fetch all rows, you must use loops. In the next slide, you see how a loop is used to fetch all the rows.

The `FETCH` statement performs the following operations:

1. Reads the data for the current row into the output PL/SQL variables
2. Advances the pointer to the next row in the active set

You can include the same number of variables in the `INTO` clause of the `FETCH` statement as there are columns in the `SELECT` statement; be sure that the data types are compatible. Match each variable to correspond to the columns positionally. Alternatively, you can also define a record for the cursor and reference the record in the `FETCH INTO` clause. Finally, test to see whether the cursor contains rows. If a fetch acquires no values, there are no rows left to process in the active set and no error is recorded.

Fetching Data from the Cursor

```
DECLARE
    CURSOR c_emp_cursor IS
        SELECT employee_id, last_name FROM employees
        WHERE department_id =30;
    v_empno employees.employee_id%TYPE;
    v_lname employees.last_name%TYPE;
BEGIN
    OPEN c_emp_cursor;
    LOOP
        FETCH c_emp_cursor INTO v_empno, v_lname;
        EXIT WHEN c_emp_cursor%NOTFOUND;
        DBMS_OUTPUT.PUT_LINE( v_empno || ' ' || v_lname);
    END LOOP;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Observe that a simple LOOP is used to fetch all the rows. Also, the cursor attribute %NOTFOUND is used to test for the exit condition. The output of the PL/SQL block is:

```
anonymous block completed
114  Raphaely
115  Khoo
116  Baida
117  Tobias
118  Himuro
119  Colmenares
```

Closing the Cursor

```
...
LOOP
  FETCH c_emp_cursor INTO empno, lname;
  EXIT WHEN c_emp_cursor%NOTFOUND;
  DBMS_OUTPUT.PUT_LINE( v_empno || ' ' || v_lname);
END LOOP;
CLOSE c_emp_cursor;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The CLOSE statement disables the cursor, releases the context area, and “undefines” the active set. Close the cursor after completing the processing of the FETCH statement. You can reopen the cursor if required. A cursor can be reopened only if it is closed. If you attempt to fetch data from a cursor after it is closed, an INVALID_CURSOR exception is raised.

Note: Although it is possible to terminate the PL/SQL block without closing cursors, you should make it a habit to close any cursor that you declare explicitly to free resources. There is a maximum limit on the number of open cursors per session, which is determined by the OPEN_CURSORS parameter in the database parameter file. (OPEN_CURSORS = 50 by default.)

Cursors and Records

Process the rows of the active set by fetching values into a PL/SQL record.

```
DECLARE
  CURSOR c_emp_cursor IS
    SELECT employee_id, last_name FROM employees
    WHERE department_id =30;
    v_emp_record  c_emp_cursor%ROWTYPE;
BEGIN
  OPEN c_emp_cursor;
  LOOP
    FETCH c_emp_cursor INTO v_emp_record;
    EXIT WHEN c_emp_cursor%NOTFOUND;
    DBMS_OUTPUT.PUT_LINE( v_emp_record.employee_id
                          || ' ' || v_emp_record.last_name);
  END LOOP;
  CLOSE c_emp_cursor;
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You have already seen that you can define records that have the structure of columns in a table. You can also define a record based on the selected list of columns in an explicit cursor. This is convenient for processing the rows of the active set, because you can simply fetch into the record. Therefore, the values of the rows are loaded directly into the corresponding fields of the record.

```
anonymous block completed
114 Raphaely
115 Khoo
116 Baida
117 Tobias
118 Himuro
119 Colmenares
```

Cursor FOR Loops

Syntax:

```
FOR record_name IN cursor_name LOOP  
    statement1;  
    statement2;  
    . . .  
END LOOP;
```

- The cursor FOR loop is a shortcut to process explicit cursors.
- Implicit open, fetch, exit, and close occur.
- The record is implicitly declared.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned to fetch data from cursors by using simple loops. You now learn to use a cursor FOR loop, which processes rows in an explicit cursor. It is a shortcut because the cursor is opened, a row is fetched once for each iteration in the loop, the loop exits when the last row is processed, and the cursor is closed automatically. The loop itself is terminated automatically at the end of the iteration where the last row is fetched.

In the syntax:

<i>record_name</i>	Is the name of the implicitly declared record
<i>cursor_name</i>	Is a PL/SQL identifier for the previously declared cursor

Guidelines

- Do not declare the record that controls the loop; it is declared implicitly.
- Test the cursor attributes during the loop if required.
- Supply the parameters for a cursor, if required, in parentheses following the cursor name in the FOR statement.

Cursor FOR Loops

```
DECLARE
  CURSOR c_emp_cursor IS
    SELECT employee_id, last_name FROM employees
    WHERE department_id =30;
BEGIN
  FOR emp_record IN c_emp_cursor
  LOOP
    DBMS_OUTPUT.PUT_LINE( emp_record.employee_id
      || ' ' || emp_record.last_name);
  END LOOP;
END;
/
```

```
anonymous block completed
114 Raphaely
115 Khoo
116 Baida
117 Tobias
118 Himuro
119 Colmenares
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example that was used to demonstrate the usage of a simple loop to fetch data from cursors is rewritten to use the cursor FOR loop.

`emp_record` is the record that is implicitly declared. You can access the fetched data with this implicit record (as shown in the slide). Observe that no variables are declared to hold the fetched data using the `INTO` clause. The code does not have the `OPEN` and `CLOSE` statements to open and close the cursor, respectively.

Explicit Cursor Attributes

Use explicit cursor attributes to obtain status information about a cursor.

Attribute	Type	Description
%ISOPEN	Boolean	Evaluates to TRUE if the cursor is open
%NOTFOUND	Boolean	Evaluates to TRUE if the most recent fetch does not return a row
%FOUND	Boolean	Evaluates to TRUE if the most recent fetch returns a row; complement of %NOTFOUND
%ROWCOUNT	Number	Evaluates to the number of rows that has been fetched

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

As with implicit cursors, there are four attributes for obtaining the status information of a cursor. When appended to the cursor variable name, these attributes return useful information about the execution of a cursor manipulation statement.

Note: You cannot reference cursor attributes directly in a SQL statement.

%ISOPEN Attribute

- You can fetch rows only when the cursor is open.
- Use the %ISOPEN cursor attribute before performing a fetch to test whether the cursor is open.

Example:

```
IF NOT c_emp_cursor%ISOPEN THEN
    OPEN c_emp_cursor;
END IF;
LOOP
    FETCH c_emp_cursor...
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- You can fetch rows only when the cursor is open. Use the %ISOPEN cursor attribute to determine whether the cursor is open.
- Fetch rows in a loop. Use cursor attributes to determine when to exit the loop.
- Use the %ROWCOUNT cursor attribute to do the following:
 - Process an exact number of rows.
 - Fetch the rows in a loop and determine when to exit the loop.

Note: %ISOPEN returns the status of the cursor: TRUE if open and FALSE if not.

%ROWCOUNT and %NOTFOUND: Example

```
DECLARE
  CURSOR c_emp_cursor IS SELECT employee_id,
    last_name FROM employees;
  v_emp_record  c_emp_cursor%ROWTYPE;
BEGIN
  OPEN c_emp_cursor;
  LOOP
    FETCH c_emp_cursor INTO v_emp_record;
    EXIT WHEN c_emp_cursor%ROWCOUNT > 10 OR
      c_emp_cursor%NOTFOUND;
    DBMS_OUTPUT.PUT_LINE( v_emp_record.employee_id
      || ' ' || v_emp_record.last_name);
  END LOOP;
  CLOSE c_emp_cursor;
END ; /
```

anonymous block completed
174 Abel
166 Ande
130 Atkinson
105 Austin
204 Baer
116 Baida
167 Banda
172 Bates
192 Bell
151 Bernstein

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide retrieves the first 10 employees one by one. This example shows how the %ROWCOUNT and %NOTFOUND attributes can be used for exit conditions in a loop.

Cursor FOR Loops Using Subqueries

There is no need to declare the cursor.

```
BEGIN
    FOR emp_record IN (SELECT employee_id, last_name
                        FROM employees WHERE department_id =30)
    LOOP
        DBMS_OUTPUT.PUT_LINE( emp_record.employee_id
            || ' ' || emp_record.last_name);
    END LOOP;
END;
/
```

```
anonymous block completed
114 Raphaely
115 Khoo
116 Baida
117 Tobias
118 Himuro
119 Colmenares
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Note that there is no declarative section in this PL/SQL block. The difference between the cursor FOR loops using subqueries and the cursor FOR loop lies in the cursor declaration. If you are writing cursor FOR loops using subqueries, you need not declare the cursor in the declarative section. You have to provide the SELECT statement that determines the active set in the loop itself.

The example that was used to illustrate a cursor FOR loop is rewritten to illustrate a cursor FOR loop using subqueries.

Note: You cannot reference explicit cursor attributes if you use a subquery in a cursor FOR loop because you cannot give the cursor an explicit name.

Agenda

- What are explicit cursors?
- Using explicit cursors
- **Using cursors with parameters**
- Locking rows and referencing the current row

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Cursors with Parameters

Syntax:

```
CURSOR cursor_name
      [ (parameter_name datatype, ... ) ]
IS
    select_statement;
```

- Pass parameter values to a cursor when the cursor is opened and the query is executed.
- Open an explicit cursor several times with a different active set each time.

```
OPEN cursor_name (parameter_value, . . . . .) ;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can pass parameters to a cursor. This means that you can open and close an explicit cursor several times in a block, returning a different active set on each occasion. For each execution, the previous cursor is closed and reopened with a new set of parameters.

Each formal parameter in the cursor declaration must have a corresponding actual parameter in the OPEN statement. Parameter data types are the same as those for scalar variables, but you do not give them sizes. The parameter names are for reference in the query expression of the cursor.

In the syntax:

<i>cursor_name</i>	Is a PL/SQL identifier for the declared cursor
<i>parameter_name</i>	Is the name of a parameter
<i>datatype</i>	Is the scalar data type of the parameter
<i>select_statement</i>	Is a SELECT statement without the INTO clause

The parameter notation does not offer greater functionality; it simply allows you to specify input values easily and clearly. This is particularly useful when the same cursor is referenced repeatedly.

Cursors with Parameters

```
DECLARE
  CURSOR c_emp_cursor (deptno NUMBER) IS
    SELECT employee_id, last_name
    FROM employees
   WHERE department_id = deptno;
  ...
BEGIN
  OPEN c_emp_cursor (10);
  ...
  CLOSE c_emp_cursor;
  OPEN c_emp_cursor (20);
  ...

```

```
anonymous block completed
200 Whalen
201 Hartstein
202 Fay
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Parameter data types are the same as those for scalar variables, but you do not give them sizes. The parameter names are for reference in the cursor's query. In the following example, a cursor is declared and is defined with one parameter:

```
DECLARE
  CURSOR c_emp_cursor(deptno NUMBER) IS SELECT ...
```

The following statements open the cursor and return different active sets:

```
OPEN c_emp_cursor(10);
OPEN c_emp_cursor(20);
```

You can pass parameters to the cursor that is used in a cursor FOR loop:

```
DECLARE
  CURSOR c_emp_cursor(p_deptno NUMBER, p_job VARCHAR2) IS
    SELECT ...
BEGIN
  FOR emp_record IN c_emp_cursor(10, 'Sales') LOOP ...
```

Agenda

- What are explicit cursors?
- Using explicit cursors
- Using cursors with parameters
- Locking rows and referencing the current row

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

FOR UPDATE Clause

Syntax:

```
SELECT ...
FROM ...
FOR UPDATE [OF column_reference] [NOWAIT | WAIT n];
```

- Use explicit locking to deny access to other sessions for the duration of a transaction.
- Lock the rows *before* the update or delete.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

If there are multiple sessions for a single database, there is the possibility that the rows of a particular table were updated after you opened your cursor. You see the updated data only when you reopen the cursor. Therefore, it is better to have locks on the rows before you update or delete rows. You can lock the rows with the `FOR UPDATE` clause in the cursor query.

In the syntax:

<code>column_reference</code>	Is a column in the table against which the query is performed (A list of columns may also be used.)
<code>NOWAIT</code>	Returns an Oracle Server error if the rows are locked by another session

The `FOR UPDATE` clause is the last clause in a `SELECT` statement, even after `ORDER BY` (if it exists). When you want to query multiple tables, you can use the `FOR UPDATE` clause to confine row locking to particular tables. `FOR UPDATE OF col_name(s)` locks rows only in tables that contain `col_name(s)`.

The `SELECT . . . FOR UPDATE` statement identifies the rows that are to be updated or deleted, and then locks each row in the result set. This is useful when you want to base an update on the existing values in a row. In that case, you must make sure that the row is not changed by another session before the update.

The optional `NOWAIT` keyword tells the Oracle Server not to wait if the requested rows have been locked by another user. Control is immediately returned to your program so that it can do other work before trying again to acquire the lock. If you omit the `NOWAIT` keyword, the Oracle Server waits until the rows are available.

Example:

```
DECLARE
    CURSOR c_emp_cursor IS
        SELECT employee_id, last_name, FROM employees
        WHERE department_id = 80 FOR UPDATE OF salary NOWAIT;
    ...

```

If the Oracle Server cannot acquire the locks on the rows it needs in a `SELECT FOR UPDATE` operation, it waits indefinitely. Use `NOWAIT` to handle such situations. If the rows are locked by another session and you have specified `NOWAIT`, opening the cursor results in an error. You can try to open the cursor later. You can use `WAIT` instead of `NOWAIT`, specify the number of seconds to wait, and then determine whether the rows are unlocked. If the rows are still locked after *n* seconds, an error is returned.

It is not mandatory for the `FOR UPDATE OF` clause to refer to a column, but specify which tables to lock if the statement is a join of multiple tables.

WHERE CURRENT OF Clause

Syntax:

```
WHERE CURRENT OF cursor ;
```

- Use cursors to update or delete the current row.
- Include the FOR UPDATE clause in the cursor query to first lock the rows.
- Use the WHERE CURRENT OF clause to reference the current row from an explicit cursor.

```
UPDATE employees  
      SET salary = ...  
 WHERE CURRENT OF c_emp_cursor;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The WHERE CURRENT OF clause is used in conjunction with the FOR UPDATE clause to refer to the current row in an explicit cursor. The WHERE CURRENT OF clause is used in the UPDATE or DELETE statement, whereas the FOR UPDATE clause is specified in the cursor declaration. You can use the combination for updating and deleting the current row from the corresponding database table. This enables you to apply updates and deletes to the row currently being addressed, without the need to explicitly reference the row ID. You must include the FOR UPDATE clause in the cursor query so that the rows are locked on OPEN.

In the syntax:

cursor Is the name of a declared cursor (The cursor must have been declared with the FOR UPDATE clause.)

Quiz

Explicit cursor functions enable the programmer to manually control explicit cursors in the PL/SQL block.

- a. True
- b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a

Summary

In this lesson, you should have learned to:

- Distinguish cursor types:
 - Implicit cursors are used for all DML statements and single-row queries.
 - Explicit cursors are used for queries of zero, one, or more rows.
- Create and handle explicit cursors
- Use simple loops and cursor FOR loops to handle multiple rows in the cursors
- Evaluate cursor status by using cursor attributes
- Use the FOR UPDATE and WHERE CURRENT OF clauses to update or delete the current fetched row

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The Oracle Server uses work areas to execute SQL statements and store processing information. You can use a PL/SQL construct called a *cursor* to name a work area and access its stored information. There are two kinds of cursors: implicit and explicit. PL/SQL implicitly declares a cursor for all SQL data manipulation statements, including queries that return only one row. For queries that return multiple rows, you must explicitly declare a cursor to process the rows individually.

Every explicit cursor and cursor variable has four attributes: %FOUND, %ISOPEN, %NOTFOUND, and %ROWCOUNT. When appended to the cursor variable name, these attributes return useful information about the execution of a SQL statement. You can use cursor attributes in procedural statements but not in SQL statements.

Use simple loops or cursor FOR loops to operate on the multiple rows fetched by the cursor. If you are using simple loops, you have to open, fetch, and close the cursor; however, cursor FOR loops do this implicitly. If you are updating or deleting rows, lock the rows by using a FOR UPDATE clause. This ensures that the data you are using is not updated by another session after you open the cursor. Use a WHERE CURRENT OF clause in conjunction with the FOR UPDATE clause to reference the current row fetched by the cursor.

Practice 8: Overview

This practice covers the following topics:

- Declaring and using explicit cursors to query rows of a table
- Using a cursor FOR loop
- Applying cursor attributes to test the cursor status
- Declaring and using cursors with parameters
- Using the FOR UPDATE and WHERE CURRENT OF clauses

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this practice, you apply your knowledge of cursors to process a number of rows from a table and populate another table with the results using a cursor FOR loop. You also write a cursor with parameters.

Handling Exceptions

ORACLE®

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Define PL/SQL exceptions
- Recognize unhandled exceptions
- List and use different types of PL/SQL exception handlers
- Trap unanticipated errors
- Describe the effect of exception propagation in nested blocks
- Customize PL/SQL exception messages

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned to write PL/SQL blocks with a declarative section and an executable section. All the SQL and PL/SQL code that must be executed is written in the executable block.

So far it has been assumed that the code works satisfactorily if you take care of compile-time errors. However, the code may cause some unanticipated errors at run time. In this lesson, you learn how to deal with such errors in the PL/SQL block.

Agenda

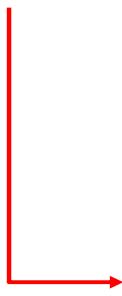

- Understanding PL/SQL exceptions
- Trapping exceptions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

What Is an Exception?

```
DECLARE
    v_lname VARCHAR2(15);
BEGIN
    SELECT last_name INTO v_lname
    FROM employees
    WHERE first_name='John';
    DBMS_OUTPUT.PUT_LINE ('John''s last name is : ' ||v_lname);
END;
```

```
Script Output x | Task completed in 0.019 seconds
Error starting at line 3 in command:
DECLARE
    v_lname VARCHAR2(15);
BEGIN
    SELECT last_name INTO v_lname FROM employees WHERE
        first_name='John';
    DBMS_OUTPUT.PUT_LINE ('John''s last name is : ' ||v_lname);
END;
Error report:
ORA-01422: exact fetch returns more than requested number of rows
ORA-06512: at line 4
01422. 00000 - "exact fetch returns more than requested number of rows"
*Cause: The number specified in exact fetch is less than the rows returned.
*Action: Rewrite the query or change number of rows requested
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Consider the example shown in the slide. There are no syntax errors in the code, which means that you must be able to successfully execute the anonymous block. The SELECT statement in the block retrieves the last name of John.

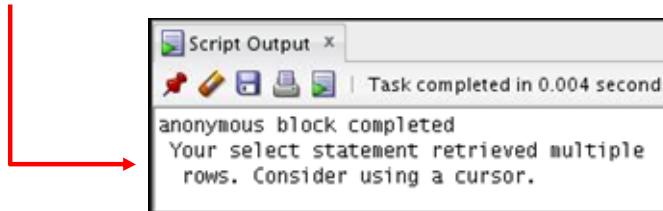

However, you see the following error report when you execute the code:

```
Error report:
ORA-01422: exact fetch returns more than requested number of rows
ORA-06512: at line 4
01422. 00000 - "exact fetch returns more than requested number of rows"
*Cause: The number specified in exact fetch is less than the rows returned.
*Action: Rewrite the query or change number of rows requested
```

The code does not work as expected. You expected the SELECT statement to retrieve only one row; however, it retrieves multiple rows. Such errors that occur at run time are called **exceptions**. When an exception occurs, the PL/SQL block is terminated. You can handle such exceptions in your PL/SQL block.

Handling the Exception: An Example

```
DECLARE
    v_lname VARCHAR2(15);
BEGIN
    SELECT last_name INTO v_lname
    FROM employees
    WHERE first_name='John';
    DBMS_OUTPUT.PUT_LINE ('John''s last name is : ' ||v_lname);
EXCEPTION
    WHEN TOO_MANY_ROWS THEN
        DBMS_OUTPUT.PUT_LINE (' Your select statement retrieved
multiple rows. Consider using a cursor.');
END;
/
```

ORACLE

You have previously learned how to write PL/SQL blocks with a declarative section (beginning with the `DECLARE` keyword) and an executable section (beginning and ending with the `BEGIN` and `END` keywords, respectively).

For exception handling, you include another optional section called the *exception section*.

- This section begins with the `EXCEPTION` keyword.
- If present, this must be the last section in a PL/SQL block.

Example

In the example in the slide, the code from the previous slide is rewritten to handle the exception that occurred. The output of the code is shown in the slide as well.

By adding the `EXCEPTION` section of the code, the PL/SQL program does not terminate abruptly. When the exception is raised, the control shifts to the exception section and all the statements in the exception section are executed. The PL/SQL block terminates with normal, successful completion

Understanding Exceptions with PL/SQL

- An exception is a PL/SQL error that is raised during program execution.
- An exception can be raised:
 - Implicitly by the Oracle Server
 - Explicitly by the program
- An exception can be handled:
 - By trapping it with a handler
 - By propagating it to the calling environment

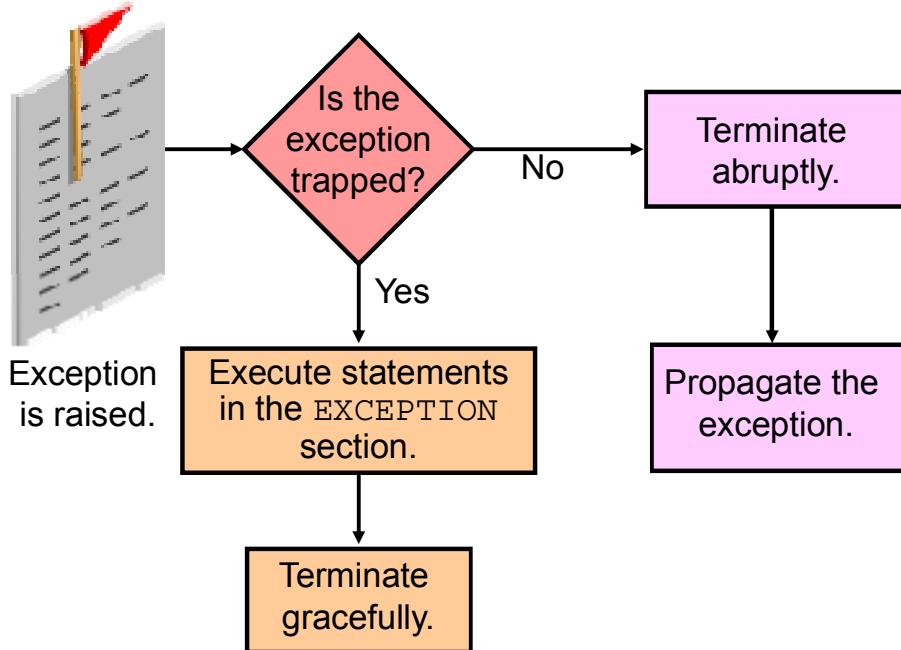

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An exception is an error in PL/SQL that is raised during the execution of a block. A block always terminates when PL/SQL raises an exception, but you can specify an exception handler to perform final actions before the block ends.

Two Methods for Raising an Exception

- An Oracle error occurs and the associated exception is raised automatically. For example, if the ORA-01403 error occurs when no rows are retrieved from the database in a SELECT statement, PL/SQL raises the NO_DATA_FOUND exception. These errors are converted into predefined exceptions.
- Depending on the business functionality your program implements, you may have to explicitly raise an exception. You raise an exception explicitly by issuing the RAISE statement in the block. The raised exception may be either user-defined or predefined. There are also some nonpredefined Oracle errors. These errors are any standard Oracle errors that are not predefined. You can explicitly declare exceptions and associate them with the nonpredefined Oracle errors.

Handling Exceptions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Trapping an Exception

Include an `EXCEPTION` section in your PL/SQL program to trap exceptions. If the exception is raised in the executable section of the block, processing branches to the corresponding exception handler in the exception section of the block. If PL/SQL successfully handles the exception, the exception does not propagate to the enclosing block or to the calling environment. The PL/SQL block terminates successfully.

Propagating an Exception

If the exception is raised in the executable section of the block and there is no corresponding exception handler, the PL/SQL block terminates with failure and the exception is propagated to an enclosing block or to the calling environment. The calling environment can be any application (such as SQL*Plus that invokes the PL/SQL program).

Exception Types

- Predefined Oracle Server
 - Nonpredefined Oracle Server
- }
- Implicitly raised
-
- User-defined
- Explicitly raised

**ORACLE**

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

There are three types of exceptions.

Exception	Description	Directions for Handling
Predefined Oracle Server error	One of approximately 20 errors that occur most often in PL/SQL code	You need not declare these exceptions. They are predefined by the Oracle server and are raised implicitly.
Nonpredefined Oracle Server error	Any other standard Oracle Server error	You need to declare these within the declarative section; the Oracle server raises the error implicitly, and you can catch the error in the exception handler.
User-defined error	A condition that the developer determines is abnormal	You need to declare in the declarative section and raise explicitly.

Note: Some application tools with client-side PL/SQL (such as Oracle Developer Forms) have their own exceptions.

Agenda

- Understanding PL/SQL exceptions
- Trapping exceptions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Syntax to Trap Exceptions

```
EXCEPTION
  WHEN exception1 [OR exception2 . . .] THEN
    statement1;
    statement2;
    . . .
  [WHEN exception3 [OR exception4 . . .] THEN
    statement1;
    statement2;
    . . .]
  [WHEN OTHERS THEN
    statement1;
    statement2;
    . . .]
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can trap any error by including a corresponding handler within the exception-handling section of the PL/SQL block. Each handler consists of a `WHEN` clause, which specifies an exception name, followed by a sequence of statements to be executed when that exception is raised.

You can include any number of handlers within an `EXCEPTION` section to handle specific exceptions. However, you cannot have multiple handlers for a single exception.

Exception-trapping syntax includes the following elements:

<code>exception</code>	Is the standard name of a predefined exception or the name of a user-defined exception declared within the declarative section
<code>statement</code>	Is one or more PL/SQL or SQL statements
<code>OTHERS</code>	Is an optional exception-handling clause that traps any exceptions that have not been explicitly handled

WHEN OTHERS Exception Handler

As stated previously, the exception-handling section traps only those exceptions that are specified.

To trap any exceptions that are not specified, you use the OTHERS exception handler. This option traps any exception not yet handled. For this reason, if the OTHERS handler is used, it must be the last exception handler that is defined.

For example:

```
WHEN NO_DATA_FOUND THEN  
    statement1;  
    ...  
WHEN TOO_MANY_ROWS THEN  
    statement1;  
    ...  
WHEN OTHERS THEN  
    statement1;
```

Example

Consider the preceding example. If the NO_DATA_FOUND exception is raised by the program, the statements in the corresponding handler are executed. If the TOO_MANY_ROWS exception is raised, the statements in the corresponding handler are executed. However, if some other exception is raised, the statements in the OTHERS exception handler are executed.

The OTHERS handler traps all the exceptions that are not already trapped. Some Oracle tools have their own predefined exceptions that you can raise to cause events in the application. The OTHERS handler also traps these exceptions.

Guidelines for Trapping Exceptions

- The EXCEPTION keyword starts the exception-handling section.
- Several exception handlers are allowed.
- Only one handler is processed before leaving the block.
- WHEN OTHERS is the last clause.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- Begin the exception-handling section of the block with the EXCEPTION keyword.
- Define several exception handlers, each with its own set of actions, for the block.
- When an exception occurs, PL/SQL processes only one handler before leaving the block.
- Place the OTHERS clause after all other exception-handling clauses.
- You can have only one OTHERS clause.
- Exceptions cannot appear in assignment statements or SQL statements.

Trapping Predefined Oracle Server Errors

- Reference the predefined name in the exception-handling routine.
- Sample predefined exceptions:
 - NO_DATA_FOUND
 - TOO_MANY_ROWS
 - INVALID_CURSOR
 - ZERO_DIVIDE
 - DUP_VAL_ON_INDEX

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Trap a predefined Oracle Server error by referencing its predefined name within the corresponding exception-handling routine.

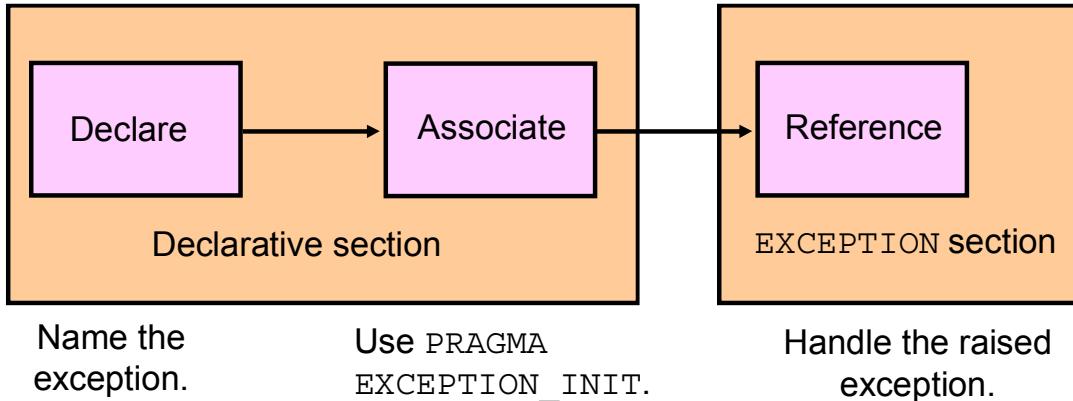

For a complete list of predefined exceptions, see the *PL/SQL User's Guide and Reference*.

Note: PL/SQL declares predefined exceptions in the STANDARD package.

Exception Name	Oracle Server Error Number	Description
ACCESS_INTO_NULL	ORA-06530	Attempted to assign values to the attributes of an uninitialized object
CASE_NOT_FOUND	ORA-06592	None of the choices in the WHEN clauses of a CASE statement are selected, and there is no ELSE clause.
COLLECTION_IS_NULL	ORA-06531	Attempted to apply collection methods other than EXISTS to an uninitialized nested table or VARRAY
CURSOR_ALREADY_OPEN	ORA-06511	Attempted to open an already open cursor
DUP_VAL_ON_INDEX	ORA-00001	Attempted to insert a duplicate value
INVALID_CURSOR	ORA-01001	Illegal cursor operation occurred.
INVALID_NUMBER	ORA-01722	Conversion of character string to number failed.
LOGIN_DENIED	ORA-01017	Logging on to the Oracle server with an invalid username or password
NO_DATA_FOUND	ORA-01403	Single row SELECT returned no data.
NOT_LOGGED_ON	ORA-01012	The PL/SQL program issues a database call without being connected to the Oracle server.
PROGRAM_ERROR	ORA-06501	PL/SQL has an internal problem.
ROWTYPE_MISMATCH	ORA-06504	The host cursor variable and PL/SQL cursor variable involved in an assignment have incompatible return types.

Exception Name	Oracle Server Error Number	Description
STORAGE_ERROR	ORA-06500	PL/SQL ran out of memory, or memory is corrupted.
SUBSCRIPT_BEYOND_COUNT	ORA-06533	Referenced a nested table or VARRAY element by using an index number larger than the number of elements in the collection
SUBSCRIPT_OUTSIDE_LIMIT	ORA-06532	Referenced a nested table or VARRAY element by using an index number that is outside the legal range (for example, -1)
SYS_INVALID_ROWID	ORA-01410	The conversion of a character string into a universal ROWID fails because the character string does not represent a valid ROWID.
TIMEOUT_ON_RESOURCE	ORA-00051	Time-out occurred while the Oracle server was waiting for a resource.
TOO_MANY_ROWS	ORA-01422	Single-row SELECT returned multiple rows.
VALUE_ERROR	ORA-06502	Arithmetic, conversion, truncation, or size-constraint error occurred.
ZERO_DIVIDE	ORA-01476	Attempted to divide by zero

Trapping Nonpredefined Oracle Server Errors

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Nonpredefined exceptions are similar to predefined exceptions; however, they are not defined as PL/SQL exceptions in the Oracle Server. They are standard Oracle errors. You create exceptions with standard Oracle errors by using the PRAGMA EXCEPTION_INIT function. Such exceptions are called nonpredefined exceptions.

You can trap a nonpredefined Oracle Server error by declaring it first. The declared exception is raised implicitly. In PL/SQL, PRAGMA EXCEPTION_INIT tells the compiler to associate an exception name with an Oracle error number. This enables you to refer to any internal exception by name and to write a specific handler for it.

Note: PRAGMA (also called *pseudoinstructions*) is the keyword that signifies that the statement is a compiler directive, which is not processed when the PL/SQL block is executed. Rather, it directs the PL/SQL compiler to interpret all occurrences of the exception name within the block as the associated Oracle Server error number.

Nonpredefined Error Trapping: Example

To trap Oracle Server error 01400 (“cannot insert NULL”):

```

DECLARE
    e_insert_excep EXCEPTION;
    PRAGMA EXCEPTION_INIT(e_insert_excep, -01400);
BEGIN
    INSERT INTO departments
        (department_id, department_name) VALUES (280, NULL);
EXCEPTION
    WHEN e_insert_excep THEN
        DBMS_OUTPUT.PUT_LINE('INSERT OPERATION FAILED');
        DBMS_OUTPUT.PUT_LINE(SQLERRM);
END;
/

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example illustrates the three steps associated with trapping a nonpredefined error:

1. Declare the name of the exception in the declarative section, using the syntax:
`exception EXCEPTION;`
In the syntax, `exception` is the name of the exception.
2. Associate the declared exception with the standard Oracle Server error number by using the `PRAGMA EXCEPTION_INIT` function. Use the following syntax:
`PRAGMA EXCEPTION_INIT(exception, error_number);`
In the syntax, `exception` is the previously declared exception and `error_number` is a standard Oracle Server error number.
3. Reference the declared exception within the corresponding exception-handling routine.

Example

The example in the slide tries to insert the `NULL` value for the `department_name` column of the `departments` table. However, the operation is not successful because `department_name` is a `NOT NULL` column. Note the following line in the example:

```
DBMS_OUTPUT.PUT_LINE(SQLERRM);
```

The `SQLERRM` function is used to retrieve the error message. You learn more about `SQLERRM` in the next few slides.

Functions for Trapping Exceptions

- SQLCODE: Returns the numeric value for the error code
- SQLERRM: Returns the message associated with the error number

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When an exception occurs, you can identify the associated error code or error message by using two functions. Based on the values of the code or the message, you can decide which subsequent actions to take.

SQLCODE returns the Oracle error number for internal exceptions. SQLERRM returns the message associated with the error number.

Function	Description
SQLCODE	Returns the numeric value for the error code (You can assign it to a NUMBER variable.)
SQLERRM	Returns character data containing the message associated with the error number

SQLCODE Values: Examples

SQLCODE Value	Description
0	No exception encountered
1	User-defined exception
+100	NO_DATA_FOUND exception
<i>negative number</i>	Another Oracle server error number

Functions for Trapping Exceptions

```
DECLARE
    error_code      NUMBER;
    error_message   VARCHAR2 (255);
BEGIN
    ...
EXCEPTION
    ...
    WHEN OTHERS THEN
        ROLLBACK;
        error_code := SQLCODE ;
        error_message := SQLERRM ;
        INSERT INTO errors (e_user, e_date, error_code,
        error_message) VALUES (USER,SYSDATE,error_code,
        error_message);
END;
/
```

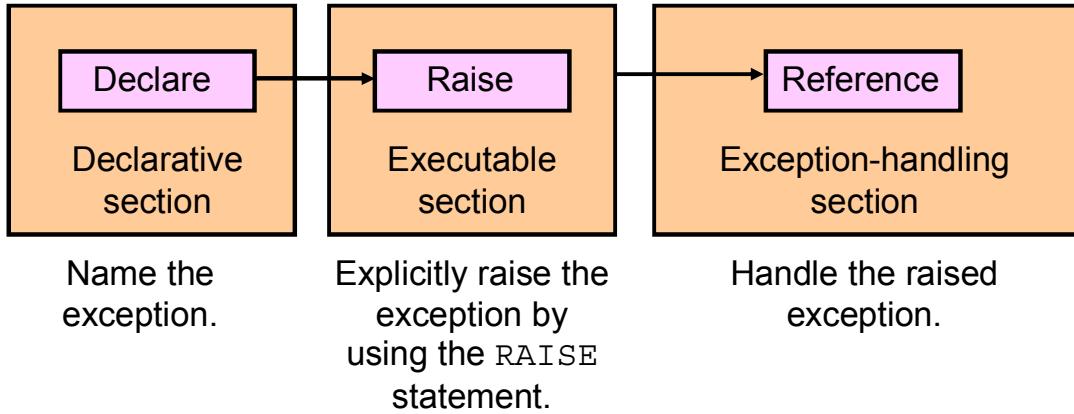

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When an exception is trapped in the WHEN OTHERS exception handler, you can use a set of generic functions to identify those errors. The example in the slide illustrates the values of SQLCODE and SQLERRM assigned to variables, and then those variables being used in a SQL statement.

You cannot use SQLCODE or SQLERRM directly in a SQL statement. Instead, you must assign their values to local variables, and then use the variables in the SQL statement, as shown in the following example:

```
DECLARE
    err_num NUMBER;
    err_msg VARCHAR2 (100);
BEGIN
    ...
EXCEPTION
    ...
    WHEN OTHERS THEN
        err_num := SQLCODE;
        err_msg := SUBSTR(SQLERRM, 1, 100);
        INSERT INTO errors VALUES (err_num, err_msg);
END;
/
```

Trapping User-Defined Exceptions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

PL/SQL enables you to define your own exceptions depending on the requirements of your application. For example, you may prompt the user to enter a department number. Define an exception to deal with error conditions in the input data. Check whether the department number exists. If it does not, you may have to raise the user-defined exception.

PL/SQL exceptions must be:

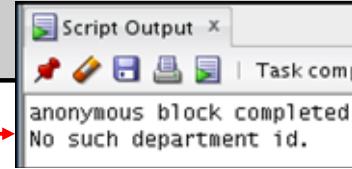

- Declared in the declarative section of a PL/SQL block
- Raised explicitly with RAISE statements
- Handled in the EXCEPTION section

Trapping User-Defined Exceptions

```

DECLARE
    v_deptno NUMBER := 500;
    v_name VARCHAR2(20) := 'Testing';
    e_invalid_department EXCEPTION; ← 1
BEGIN
    UPDATE departments
    SET department_name = v_name
    WHERE department_id = v_deptno;
    IF SQL%NOTFOUND THEN
        RAISE e_invalid_department; ← 2
    END IF;
    COMMIT;
EXCEPTION
    WHEN e_invalid_department THEN
        DBMS_OUTPUT.PUT_LINE('No such department id.');
END;
/

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You trap a user-defined exception by declaring it and raising it explicitly.

1. Declare the name of the user-defined exception within the declarative section.

Syntax:

```
exception EXCEPTION;
```

In the syntax, *exception* is the name of the exception.

2. Use the RAISE statement to raise the exception explicitly within the executable section.

Syntax:

```
RAISE exception;
```

In the syntax, *exception* is the previously declared exception.

3. Reference the declared exception within the corresponding exception-handling routine.

Example

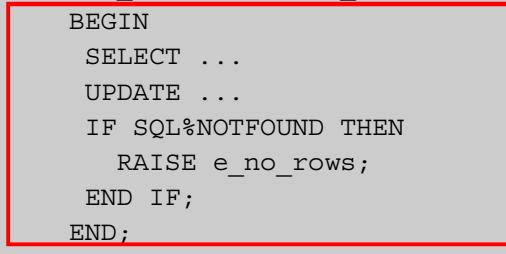

The block shown in the slide updates the `department_name` of a department. The user supplies the department number and the new name. If the supplied department number does not exist, no rows are updated in the `departments` table. An exception is raised and a message is printed for the user that an invalid department number was entered.

Note: Use the RAISE statement by itself within an exception handler to raise the same exception again and propagate it back to the calling environment.

Propagating Exceptions in a Subblock

Subblocks can handle an exception or pass the exception to the enclosing block.

```
DECLARE
    . .
    e_no_rows      exception;
    e_integrity     exception;
    PRAGMA EXCEPTION_INIT (e_integrity, -2292);
BEGIN
    FOR c_record IN emp_cursor LOOP
        BEGIN
            SELECT ...
            UPDATE ...
            IF SQL%NOTFOUND THEN
                RAISE e_no_rows;
            END IF;
        END;
    END LOOP;
EXCEPTION
    WHEN e_integrity THEN ...
    WHEN e_no_rows THEN ...
END;
/
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When a subblock handles an exception, it terminates normally. Control resumes in the enclosing block immediately after the subblock's `END` statement.

However, if a PL/SQL raises an exception and the current block does not have a handler for that exception, the exception propagates to successive enclosing blocks until it finds a handler. If none of these blocks handles the exception, an unhandled exception in the host environment results.

When the exception propagates to an enclosing block, the remaining executable actions in that block are bypassed.

One advantage of this behavior is that you can enclose statements that require their own exclusive error handling in their own block, while leaving more general exception handling to the enclosing block.

Note in the example that the exceptions (`no_rows` and `integrity`) are declared in the outer block. In the inner block, when the `no_rows` exception is raised, PL/SQL looks for the exception to be handled in the subblock. Because the exception is not handled in the subblock, the exception propagates to the outer block, where PL/SQL finds the handler.

The RAISE Statement

- Stops normal execution of a PL/SQL block or subprogram and transfers control to an exception handler
- Explicitly raises predefined exceptions or user-defined exceptions
- Syntax:

```
RAISE exception_name ;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the syntax, the `exception_name` is the name of a predefined or a user-defined exception. The `exception_name` is optional only in an exception handler, where the default is the current exception. Outside an exception handler, you must specify the name of the exception.

RAISE_APPLICATION_ERROR Procedure

Syntax:

```
raise_application_error (error_number,  
                      message[, {TRUE | FALSE}]);
```

- You can use this procedure to issue user-defined error messages from stored subprograms.
- You can report errors to your application and avoid returning unhandled exceptions.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use the RAISE_APPLICATION_ERROR procedure to communicate a predefined exception interactively by returning a nonstandard error code and error message. With RAISE_APPLICATION_ERROR, you can report errors to your application and avoid returning unhandled exceptions.

In the syntax:

<i>error_number</i>	Is a user-specified number for the exception between –20,000 and –20,999
<i>message</i>	Is the user-specified message for the exception; is a character string up to 2,048-bytes long
TRUE FALSE	Is an optional Boolean parameter (If TRUE, the error is placed on the stack of previous errors. If FALSE, which is the default, the error replaces all previous errors.)

RAISE_APPLICATION_ERROR Procedure

- Is used in two different places:
 - Executable section
 - Exception section
- Returns error conditions to the user in a manner consistent with other Oracle Server errors

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The RAISE_APPLICATION_ERROR procedure can be used in either the executable section or the exception section of a PL/SQL program, or both. The returned error is consistent with how the Oracle Server produces a predefined, nonpredefined, or user-defined error. The error number and message are displayed to the user.

RAISE_APPLICATION_ERROR Procedure

Executable section:

```
BEGIN
...
    DELETE FROM employees
        WHERE manager_id = v_mgr;
    IF SQL%NOTFOUND THEN
        RAISE_APPLICATION_ERROR(-20202,
            'This is not a valid manager');
    END IF;
    ...

```

Exception section:

```
...
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        RAISE_APPLICATION_ERROR (-20201,
            'Manager is not a valid employee.');
END;
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide shows that the RAISE_APPLICATION_ERROR procedure can be used in both the executable and the exception sections of a PL/SQL program.

Here is another example of using the RAISE_APPLICATION_ERROR procedure:

```
DECLARE
    e_name EXCEPTION;
BEGIN
    ...
    DELETE FROM employees
        WHERE last_name = 'Higgins';
    IF SQL%NOTFOUND THEN RAISE e_name;
    END IF;
EXCEPTION
    WHEN e_name THEN
        RAISE_APPLICATION_ERROR (-20999, 'This is not a valid last
name'); ...
END;
/
```

Quiz

You can trap any error by including a corresponding handler within the exception-handling section of the PL/SQL block.

- a. True
- b. False

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a

You can trap any error by including a corresponding handler within the exception-handling section of the PL/SQL block. Each handler consists of a `WHEN` clause, which specifies an exception name, followed by a sequence of statements to be executed when that exception is raised. You can include any number of handlers within an `EXCEPTION` section to handle specific exceptions. However, you cannot have multiple handlers for a single exception.

Summary

In this lesson, you should have learned to:

- Define PL/SQL exceptions
- Add an EXCEPTION section to the PL/SQL block to deal with exceptions at run time
- Handle different types of exceptions:
 - Predefined exceptions
 - Non-predefined exceptions
 - User-defined exceptions
- Propagate exceptions in nested blocks and call applications

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this lesson, you learned how to deal with different types of exceptions. In PL/SQL, a warning or error condition at run time is called an exception. Predefined exceptions are error conditions that are defined by the Oracle Server. Nonpredefined exceptions can be any standard Oracle Server errors. User-defined exceptions are exceptions specific to your application. The PRAGMA EXCEPTION_INIT function can be used to associate a declared exception name with an Oracle Server error.

You can define exceptions of your own in the declarative section of any PL/SQL block. For example, you can define an exception named INSUFFICIENT_FUNDS to flag overdrawn bank accounts.

When an error occurs, an exception is raised. Normal execution stops and transfers control to the exception-handling section of your PL/SQL block. Internal exceptions are raised implicitly (automatically) by the run-time system; however, user-defined exceptions must be raised explicitly. To handle raised exceptions, you write separate routines called exception handlers.

Practice 9: Overview

This practice covers the following topics:

- Creating and invoking user-defined exceptions
- Handling named Oracle Server exceptions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In these practices, you create exception handlers for a predefined exception and a standard Oracle Server exception.

Introducing Stored Procedures and Functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Differentiate between anonymous blocks and subprograms
- Create a simple procedure and invoke it from an anonymous block
- Create a simple function
- Create a simple function that accepts a parameter
- Differentiate between procedures and functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You learned about anonymous blocks. This lesson introduces you to named blocks, which are also called *subprograms*. Procedures and functions are PL/SQL subprograms. In the lesson, you learn to differentiate between anonymous blocks and subprograms.

Agenda

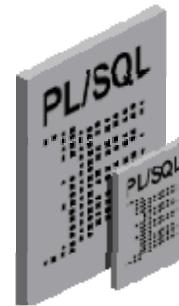

- Introducing procedures and functions
- Previewing procedures
- Previewing functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Procedures and Functions

- Are named PL/SQL blocks
- Are called PL/SQL subprograms
- Have block structures similar to anonymous blocks:
 - Optional declarative section (without the `DECLARE` keyword)
 - Mandatory executable section
 - Optional section to handle exceptions

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Up to this point, anonymous blocks were the only examples of PL/SQL code covered in this course. As the name indicates, *anonymous* blocks are unnamed executable PL/SQL blocks. Because they are unnamed, they can be neither reused nor stored for later use.

Procedures and functions are named PL/SQL blocks that are also known as *subprograms*. These subprograms are compiled and stored in the database. The block structure of the subprograms is similar to the structure of anonymous blocks. Subprograms can be declared not only at the schema level but also within any other PL/SQL block. A subprogram contains the following sections:

- **Declarative section:** Subprograms can have an optional declarative section. However, unlike anonymous blocks, the declarative section of a subprogram does not start with the `DECLARE` keyword. The optional declarative section follows the `IS` or `AS` keyword in the subprogram declaration.
- **Executable section:** This is the mandatory section of the subprogram, which contains the implementation of the business logic. Looking at the code in this section, you can easily determine the business functionality of the subprogram. This section begins and ends with the `BEGIN` and `END` keywords, respectively.
- **Exception section:** This is an optional section that is included to handle exceptions.

Differences Between Anonymous Blocks and Subprograms

Anonymous Blocks	Subprograms
Unnamed PL/SQL blocks	Named PL/SQL blocks
Compiled every time	Compiled only once
Not stored in the database	Stored in the database
Cannot be invoked by other applications	Named and, therefore, can be invoked by other applications
Do not return values	If functions, must return values
Cannot take parameters	Can take parameters

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The table in the slide not only shows the differences between anonymous blocks and subprograms, but also highlights the general benefits of subprograms.

Anonymous blocks are not persistent database objects. They are compiled every time they are to be executed. They are not stored in the database for reuse. If you want to reuse them, you must rerun the script that creates the anonymous block, which causes recompilation and execution.

Procedures and functions are compiled and stored in the database in a compiled form. They are recompiled only when they are modified. Because they are stored in the database, any application can make use of these subprograms based on appropriate permissions. The calling application can pass parameters to the procedures if the procedure is designed to accept parameters. Similarly, a calling application can retrieve a value if it invokes a function or a procedure.

Agenda

- Introducing procedures and functions
- Previewing procedures
- Previewing functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Procedure: Syntax

```
CREATE [OR REPLACE] PROCEDURE procedure_name
  [(argument1 mode1 datatype1,
    argument2 mode2 datatype2,
    . . .)]
IS | AS
procedure_body;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide shows the syntax for creating procedures. In the syntax:

procedure_name Is the name of the procedure to be created

argument Is the name given to the procedure parameter. Every argument is associated with a mode and data type. You can have any number of arguments separated by commas.

mode Mode of argument:
IN (default)
OUT
IN OUT

datatype Is the data type of the associated parameter. The data type of parameters cannot have explicit size; instead, use %TYPE.

Procedure_body Is the PL/SQL block that makes up the code

The argument list is optional in a procedure declaration. You learn about procedures in detail in the course titled *Oracle Database: Develop PL/SQL Program Units*.

Creating a Procedure

```
...
CREATE TABLE dept AS SELECT * FROM departments;
CREATE PROCEDURE add_dept IS
    v_dept_id dept.department_id%TYPE;
    v_dept_name dept.department_name%TYPE;
BEGIN
    v_dept_id:=280;
    v_dept_name:='ST-Curriculum';
    INSERT INTO dept(department_id,department_name)
    VALUES(v_dept_id,v_dept_name);
    DBMS_OUTPUT.PUT_LINE(' Inserted '|| SQL%ROWCOUNT
    || ' row ');
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the code example, the `add_dept` procedure inserts a new department with department ID 280 and department name ST-Curriculum.

In addition, the example shows the following:

- The declarative section of a procedure starts immediately after the procedure declaration and does not begin with the `DECLARE` keyword.
- The procedure declares two variables, `dept_id` and `dept_name`.
- The procedure uses the implicit cursor attribute or the `SQL%ROWCOUNT` SQL attribute to verify that the row was successfully inserted. A value of 1 should be returned in this case.

Note: See the following page for more notes on the example.

Procedure: Example

Note

- When you create any object, the entries are made to the `user_objects` table. When the code in the slide is executed successfully, you can check the `user_objects` table for the new objects by issuing the following command:

```
SELECT object_name,object_type FROM user_objects;
```

OBJECT_NAME	OBJECT_TYPE
35 GREET	PROCEDURE
36 DEPT_PKG	PACKAGE
37 DEPT_PKG	PACKAGE BODY
38 RETIRED_EMPS	TABLE
39 ERROR_PKG	PACKAGE
40 EMPL	TABLE
41 MESSAGES	TABLE
42 HELLO	PROCEDURE
43 EMP	TABLE
44 DEPT	TABLE
45 ADD_DEPT	PROCEDURE

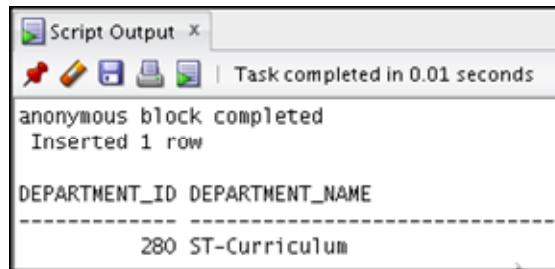

- The source of the procedure is stored in the `user_source` table. You can check the source for the procedure by issuing the following command:

```
SELECT * FROM user_source WHERE name='ADD_DEPT' ;
```

NAME	TYPE	LINE	TEXT
1 ADD_DEPT	PROCEDURE	1	PROCEDURE add_dept IS
2 ADD_DEPT	PROCEDURE	2	v_dept_id dept.department_id%TYPE;
3 ADD_DEPT	PROCEDURE	3	v_dept_name dept.department_name%TYPE;
4 ADD_DEPT	PROCEDURE	4	BEGIN
5 ADD_DEPT	PROCEDURE	5	v_dept_id:=280;
6 ADD_DEPT	PROCEDURE	6	v_dept_name:='ST-Curriculum';
7 ADD_DEPT	PROCEDURE	7	INSERT INTO dept(department_id,department_name)
8 ADD_DEPT	PROCEDURE	8	VALUES(v_dept_id,v_dept_name);
9 ADD_DEPT	PROCEDURE	9	DBMS_OUTPUT.PUT_LINE(' Inserted SQL%ROWCOUNT row');
10 ADD_DEPT	PROCEDURE	10	END;

Invoking a Procedure

```
...
BEGIN
  add_dept;
END;
/
SELECT department_id, department_name FROM dept
WHERE department_id=280;
```

The screenshot shows the 'Script Output' window from Oracle SQL Developer. It displays the results of an anonymous block execution. The output shows 'Task completed in 0.01 seconds', 'anonymous block completed', and 'Inserted 1 row'. Below this, a SELECT statement is shown with the result: DEPARTMENT_ID DEPARTMENT_NAME, with a single row 280 ST-Curriculum.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide shows how to invoke a procedure from an anonymous block. You must include the call to the procedure in the executable section of the anonymous block. Similarly, you can invoke the procedure from any application, such as a Forms application or a Java application. The `SELECT` statement in the code checks to see whether the row was successfully inserted. You can also invoke a procedure with the SQL statement `CALL <procedure_name>`.

Agenda

- Introducing procedures and functions
- Previewing procedures
- Previewing functions

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Function: Syntax

```
CREATE [OR REPLACE] FUNCTION function_name
[ (argument1 [mode1] datatype1,
  argument2 [mode2] datatype2,
  . . . ) ]
RETURN datatype
IS|AS
function_body;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The slide shows the syntax for creating a function. In the syntax:

<i>function_name</i>	Is the name of the function to be created
<i>argument</i>	Is the name given to the function parameter (Every argument is associated with a mode and data type. You can have any number of arguments separated by a comma. You pass the argument when you invoke the function.)
<i>mode</i>	Is the type of parameter (Only <code>IN</code> parameters should be declared.)
<i>datatype</i>	Is the data type of the associated parameter
<code>RETURN</code> <i>datatype</i>	Is the data type of the value returned by the function
<i>function_body</i>	Is the PL/SQL block that makes up the function code

The argument list is optional in the function declaration. The difference between a procedure and a function is that a function must return a value to the calling program. Therefore, the syntax contains *return_type*, which specifies the data type of the value that the function returns. A procedure may return a value via an `OUT` or `IN OUT` parameter.

Creating a Function

```
CREATE FUNCTION check_sal RETURN Boolean IS
v_dept_id employees.department_id%TYPE;
v_empno   employees.employee_id%TYPE;
v_sal      employees.salary%TYPE;
v_avg_sal  employees.salary%TYPE;
BEGIN
  v_empno:=205;
  SELECT salary,department_id INTO v_sal,v_dept_id FROM
employees
  WHERE employee_id= v_empno;
  SELECT avg(salary) INTO v_avg_sal FROM employees WHERE
department_id=v_dept_id;
  IF v_sal > v_avg_sal THEN
    RETURN TRUE;
  ELSE
    RETURN FALSE;
  END IF;
EXCEPTION
  WHEN NO_DATA_FOUND THEN
    RETURN NULL;
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

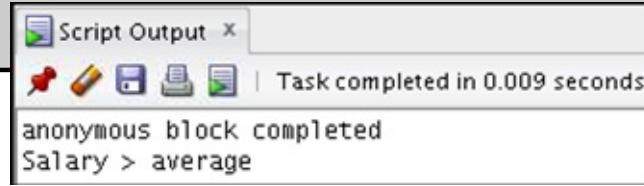

Function: Example

The `check_sal` function is written to determine whether the salary of a particular employee is greater than or less than the average salary of all employees working in the same department. The function returns `TRUE` if the salary of the employee is greater than the average salary of the employees in the department; if not, it returns `FALSE`. The function returns `NULL` if a `NO_DATA_FOUND` exception is thrown.

Note that the function checks for the employee with the employee ID 205. The function is hard-coded to check only for this employee ID. If you want to check for any other employees, you must modify the function itself. You can solve this problem by declaring the function such that it accepts an argument. You can then pass the employee ID as parameter.

Invoking a Function

```
BEGIN
  IF (check_sal IS NULL) THEN
    DBMS_OUTPUT.PUT_LINE('The function returned
      NULL due to exception');
  ELSIF (check_sal) THEN
    DBMS_OUTPUT.PUT_LINE('Salary > average');
  ELSE
    DBMS_OUTPUT.PUT_LINE('Salary < average');
  END IF;
END;
/
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You include the call to the function in the executable section of the anonymous block. The function is invoked as a part of a statement. Remember that the `check_sal` function returns Boolean or NULL. Thus the call to the function is included as the conditional expression for the IF block.

Note: You can use the DESCRIBE command to check the arguments and return type of the function, as in the following example:

```
DESCRIBE check_sal;
```

Passing a Parameter to the Function

```
DROP FUNCTION check_sal;
CREATE FUNCTION check_sal(p_empno employees.employee_id%TYPE)
RETURN Boolean IS
    v_dept_id employees.department_id%TYPE;
    v_sal      employees.salary%TYPE;
    v_avg_sal employees.salary%TYPE;
BEGIN
    SELECT salary,department_id INTO v_sal,v_dept_id FROM employees
        WHERE employee_id=p_empno;
    SELECT avg(salary) INTO v_avg_sal FROM employees
        WHERE department_id=v_dept_id;
    IF v_sal > v_avg_sal THEN
        RETURN TRUE;
    ELSE
        RETURN FALSE;
    END IF;
EXCEPTION
    ...
END;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Remember that the function was hard-coded to check the salary of the employee with employee ID 205. The code shown in the slide removes that constraint because it is rewritten to accept the employee number as a parameter. You can now pass different employee numbers and check for the employee's salary.

You learn more about functions in the course titled *Oracle Database: Develop PL/SQL Program Units*.

The output of the code example in the slide is as follows:

A screenshot of the Oracle SQL Developer interface showing the 'Script Output' window. The window title is 'Script Output'. It contains a toolbar with icons for script, edit, save, and run, followed by the message 'Task completed'. Below the toolbar, the output text is displayed:

```
function CHECK_SAL dropped.
FUNCTION check_sal compiled
```

Invoking the Function with a Parameter

```
BEGIN
DBMS_OUTPUT.PUT_LINE('Checking for employee with id 205');
IF (check_sal(205) IS NULL) THEN
DBMS_OUTPUT.PUT_LINE('The function returned
NULL due to exception');
ELSIF (check_sal(205)) THEN
DBMS_OUTPUT.PUT_LINE('Salary > average');
ELSE
DBMS_OUTPUT.PUT_LINE('Salary < average');
END IF;
DBMS_OUTPUT.PUT_LINE('Checking for employee with id 70');
IF (check_sal(70) IS NULL) THEN
DBMS_OUTPUT.PUT_LINE('The function returned
NULL due to exception');
ELSIF (check_sal(70)) THEN
...
END IF;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The code in the slide invokes the function twice by passing parameters. The output of the code is as follows:

A screenshot of a "Script Output" window from an Oracle database client. The window title is "Script Output". It shows the execution of an anonymous block. The output pane displays the following text:

```
anonymous block completed
Checking for employee with id 205
Salary > average
Checking for employee with id 70
The function returned NULL due to exception
```

Quiz

Subprograms:

- a. Are named PL/SQL blocks and can be invoked by other applications
- b. Are compiled only once
- c. Are stored in the database
- d. Do not have to return values if they are functions
- e. Can take parameters

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Answer: a, b, c, e

Summary

In this lesson, you should have learned to:

- Create a simple procedure
- Invoke the procedure from an anonymous block
- Create a simple function
- Create a simple function that accepts parameters
- Invoke the function from an anonymous block

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use anonymous blocks to design any functionality in PL/SQL. However, the major constraint with anonymous blocks is that they are not stored and, therefore, cannot be reused. Instead of creating anonymous blocks, you can create PL/SQL subprograms. Procedures and functions are called subprograms, which are named PL/SQL blocks. Subprograms express reusable logic by virtue of parameterization. The structure of a procedure or function is similar to the structure of an anonymous block. These subprograms are stored in the database and are, therefore, reusable.

Practice 10: Overview

This practice covers the following topics:

- Converting an existing anonymous block to a procedure
- Modifying the procedure to accept a parameter
- Writing an anonymous block to invoke the procedure

Using SQL Developer

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this appendix, you should be able to do the following:

- List the key features of Oracle SQL Developer
- Identify the menu items of Oracle SQL Developer
- Create a database connection
- Manage database objects
- Use SQL Worksheet
- Save and run SQL scripts
- Create and save reports
- Browse the Data Modeling options in SQL Developer

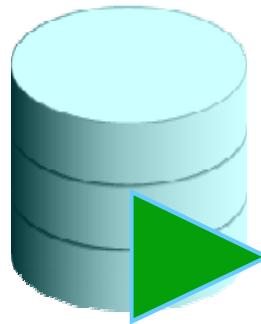

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In this appendix, you are introduced to the graphical tool called SQL Developer. You learn how to use SQL Developer for your database development tasks. You learn how to use SQL Worksheet to execute SQL statements and SQL scripts.

What Is Oracle SQL Developer?

- Oracle SQL Developer is a graphical tool that enhances productivity and simplifies database development tasks.
- You can connect to any target Oracle database schema by using standard Oracle database authentication.

SQL Developer

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Oracle SQL Developer is a free graphical tool designed to improve your productivity and simplify the development of everyday database tasks. With just a few clicks, you can easily create and debug stored procedures, test SQL statements, and view optimizer plans.

SQL Developer, which is the visual tool for database development, simplifies the following tasks:

- Browsing and managing database objects
- Executing SQL statements and scripts
- Editing and debugging PL/SQL statements
- Creating reports

You can connect to any target Oracle database schema by using standard Oracle database authentication. When connected, you can perform operations on objects in the database.

SQL Developer is the interface to administer the Oracle Application Express Listener. The new interface enables you to specify global settings and multiple database settings with different database connections for the Application Express Listener. SQL Developer provides the option to drag and drop objects by table or column name onto the worksheet. It provides improved DB Diff comparison options, GRANT statements support in the SQL editor, and DB Doc reporting. Additionally, SQL Developer includes support for 12c Database features.

Specifications of SQL Developer

- Is shipped along with Oracle Database 12c Release 1
- Is developed in Java
- Supports Windows, Linux, and Mac OS X platforms
- Enables default connectivity using the JDBC Thin driver
- Connects to Oracle Database version 9.2.0.1 and later

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

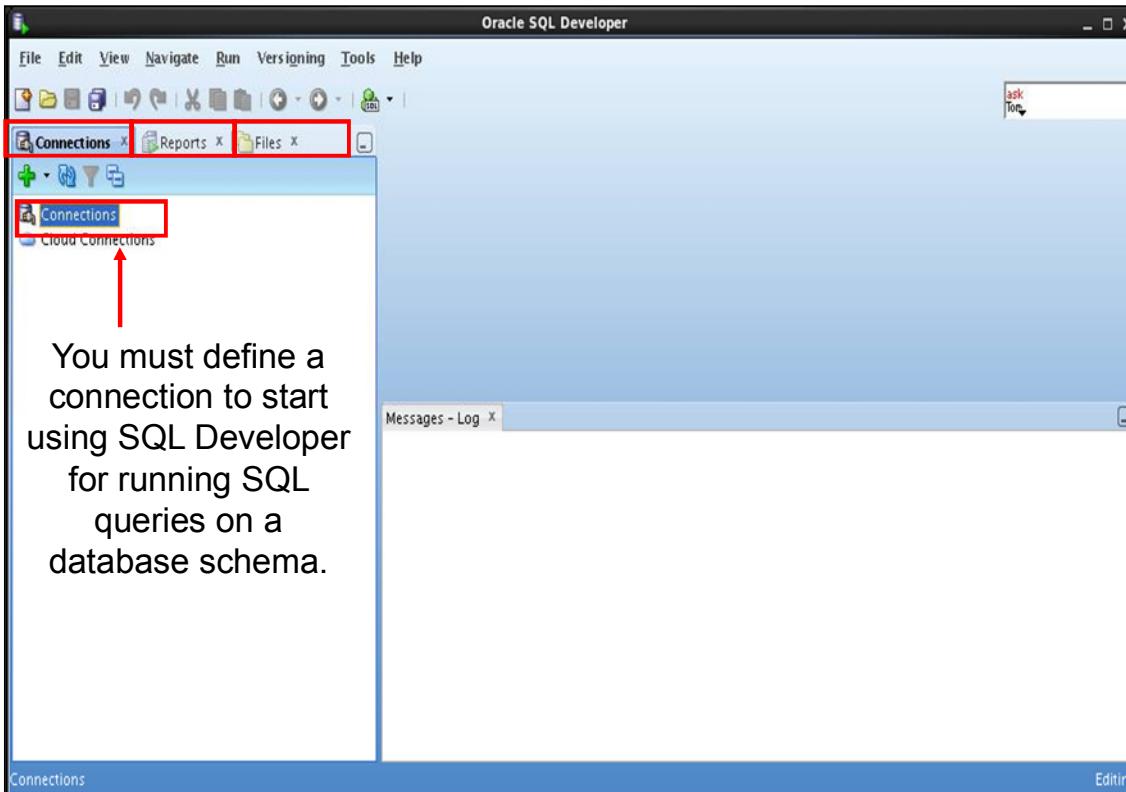

Oracle SQL Developer is shipped along with Oracle Database 12c Release 1 by default. SQL Developer is developed in Java, leveraging the Oracle JDeveloper integrated development environment (IDE). Therefore, it is a cross-platform tool. The tool runs on Windows, Linux, and Mac operating system (OS) X platforms.

The default connectivity to the database is through the Java Database Connectivity (JDBC) Thin driver, and therefore, no Oracle Home is required. SQL Developer does not require an installer and you need to simply unzip the downloaded file. With SQL Developer, users can connect to Oracle Databases 9.2.0.1 and later, and all Oracle database editions, including Express Edition.

Note

- For Oracle Database 12c Release 1, you will have to download and install SQL Developer. SQL Developer can be downloaded for free from the following link:
<http://www.oracle.com/technetwork/developer-tools/sql-developer/downloads/index.html>
- For instructions on how to install SQL Developer, see the website at:
<http://www.oracle.com/technetwork/developer-tools/sql-developer/overview/index.html>

SQL Developer 3.2 Interface

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The SQL Developer interface contains three main navigation tabs, from left to right:

- **Connections tab:** By using this tab, you can browse database objects and users to which you have access.
- **Reports tab:** Identified by the Reports icon, this tab enables you to run predefined reports or create and add your own reports.
- **Files tab:** Identified by the Files folder icon, this tab enables you to access files from your local machine without having to use the File > Open menu.

General Navigation and Use

SQL Developer uses the left side for navigation to find and select objects, and the right side to display information about selected objects. You can customize many aspects of the appearance and behavior of SQL Developer by setting preferences.

Note: You need to define at least one connection to be able to connect to a database schema and issue SQL queries or run procedures and functions.

Menus

The following menus contain standard entries, plus entries for features that are specific to SQL Developer:

- **View:** Contains options that affect what is displayed in the SQL Developer interface
- **Navigate:** Contains options for navigating to panes and for executing subprograms
- **Run:** Contains the Run File and Execution Profile options that are relevant when a function or procedure is selected, and also debugging options
- **Versioning:** Provides integrated support for the following versioning and source control systems – Concurrent Versions System (CVS) and Subversion
- **Tools:** Invokes SQL Developer tools such as SQL*Plus, Preferences, and SQL Worksheet. It also contains options related to migrating third-party databases to Oracle.

Note: The Run menu also contains options that are relevant when a function or procedure is selected for debugging.

Creating a Database Connection

- You must have at least one database connection to use SQL Developer.
- You can create and test connections for:
 - Multiple databases
 - Multiple schemas
- SQL Developer automatically imports any connections defined in the `tnsnames.ora` file on your system.
- You can export connections to an Extensible Markup Language (XML) file.
- Each additional database connection created is listed in the Connections Navigator hierarchy.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A connection is a SQL Developer object that specifies the necessary information for connecting to a specific database as a specific user of that database. To use SQL Developer, you must have at least one database connection, which may be existing, created, or imported.

You can create and test connections for multiple databases and for multiple schemas.

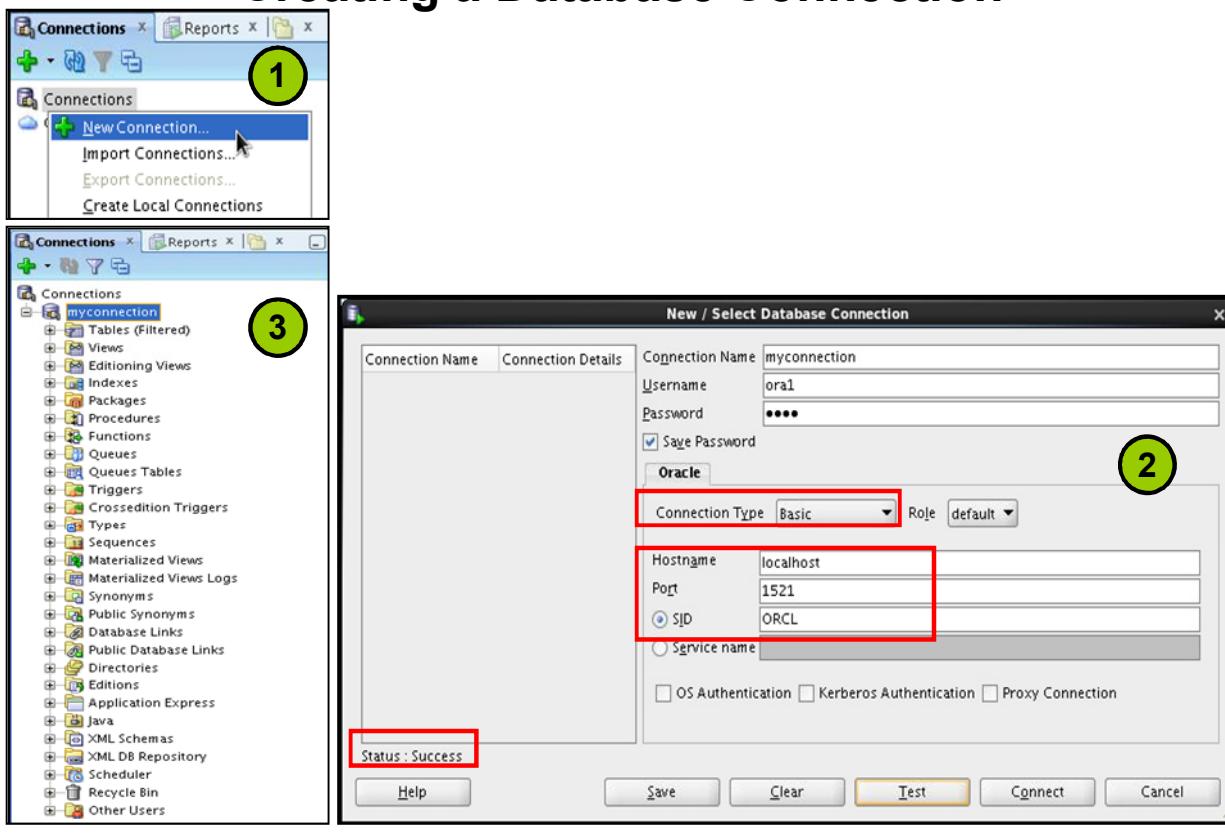

By default, the `tnsnames.ora` file is located in the `$ORACLE_HOME/network/admin` directory, but it can also be in the directory specified by the `TNS_ADMIN` environment variable or registry value. When you start SQL Developer and open the Database Connections dialog box, SQL Developer automatically imports any connections defined in the `tnsnames.ora` file on your system.

Note: On Windows, if the `tnsnames.ora` file exists, but its connections are not being used by SQL Developer, define `TNS_ADMIN` as a system environment variable.

You can export connections to an XML file so that you can reuse it.

You can create additional connections as different users to the same database or to connect to the different databases.

Creating a Database Connection

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

ORACLE

To create a database connection, perform the following steps:

1. On the Connections tabbed page, right-click **Connections** and select **New Connection**.
2. In the New/Select Database Connection window, enter the connection name. Enter the username and password of the schema that you want to connect to.
 - a. From the Role drop-down list, you can select either *default* or **SYSDBA**. (You choose **SYSDBA** for the **sys** user or any user with database administrator privileges.)
 - b. You can select the connection type as:
 - Basic:** In this type, enter host name and SID for the database that you want to connect to. Port is already set to 1521. You can also choose to enter the Service name directly if you use a remote database connection.
 - TNS:** You can select any one of the database aliases imported from the **tnsnames.ora** file.
 - LDAP:** You can look up database services in Oracle Internet Directory, which is a component of Oracle Identity Management.
 - Advanced:** You can define a custom Java Database Connectivity (JDBC) URL to connect to the database.

Local/Bequeath: If the client and database exist on the same computer, a client connection can be passed directly to a dedicated server process without going through the listener.

- c. Click Test to ensure that the connection has been set correctly.
- d. Click Connect.

If you select the Save Password check box, the password is saved to an XML file. So, after you close the SQL Developer connection and open it again, you are not prompted for the password.

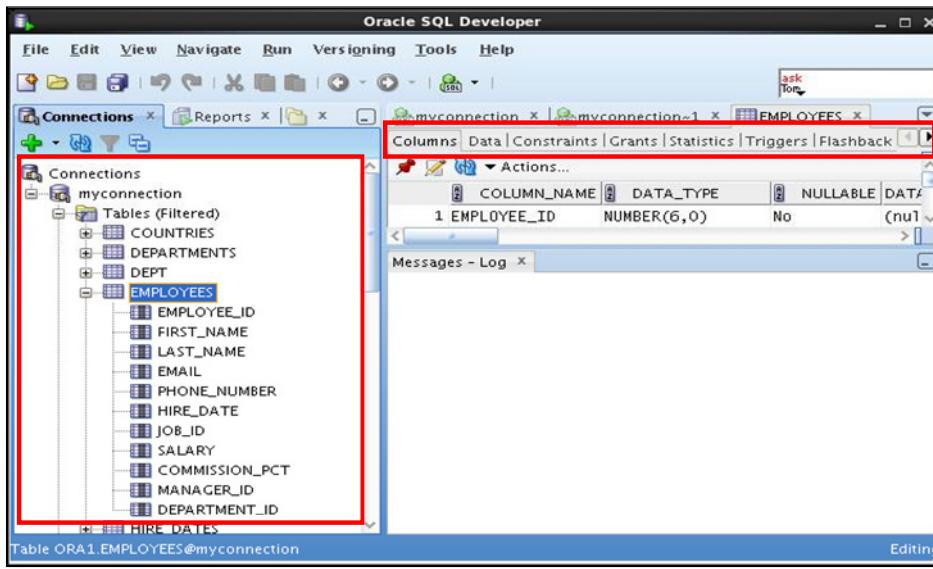

3. The connection gets added in the Connections Navigator. You can expand the connection to view the database objects and view object definitions—for example, dependencies, details, statistics, and so on.

Note: From the same New>Select Database Connection window, you can define connections to non-Oracle data sources using the Access, MySQL, and SQL Server tabs. However, these connections are read-only connections that enable you to browse objects and data in that data source.

Browsing Database Objects

Use the Connections Navigator to:

- Browse through many objects in a database schema
- Review the definitions of objects at a glance

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

After you create a database connection, you can use the Connections Navigator to browse through many objects in a database schema, including Tables, Views, Indexes, Packages, Procedures, Triggers, and Types.

SQL Developer uses the left side for navigation to find and select objects, and the right side to display information about the selected objects. You can customize many aspects of the appearance of SQL Developer by setting preferences.

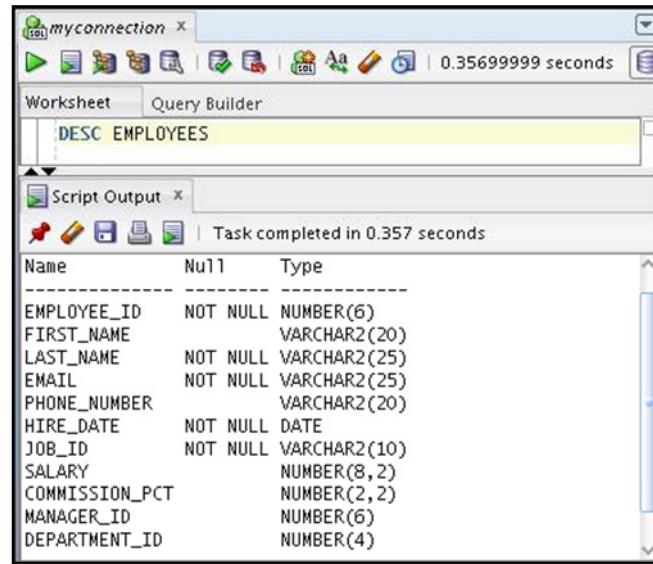

You can see the definition of the objects broken into tabs of information that is pulled out of the data dictionary. For example, if you select a table in the Navigator, details about columns, constraints, grants, statistics, triggers, and so on are displayed on an easy-to-read tabbed page.

If you want to see the definition of the EMPLOYEES table as shown in the slide, perform the following steps:

1. Expand the Connections node in the Connections Navigator.
2. Expand Tables.
3. Click EMPLOYEES. By default, the Columns tab is selected. It shows the column description of the table. Using the Data tab, you can view the table data and also enter new rows, update data, and commit these changes to the database.

Displaying the Table Structure

Use the DESCRIBE command to display the structure of a table:

The screenshot shows the Oracle SQL Developer interface. In the top-left corner, there's a connection named "myconnection". Below it, the "Worksheet" tab is active, showing the command "DESC EMPLOYEES" in the text area. To the right of the worksheet is a "Script Output" window which displays the results of the query. The results are presented as a table with three columns: Name, Null, and Type. The data shows the structure of the EMPLOYEES table, including columns like EMPLOYEE_ID, FIRST_NAME, LAST_NAME, EMAIL, PHONE_NUMBER, HIRE_DATE, JOB_ID, SALARY, COMMISSION_PCT, MANAGER_ID, and DEPARTMENT_ID, along with their respective data types (NUMBER or VARCHAR2).

Name	Null	Type
EMPLOYEE_ID	NOT NULL	NUMBER(6)
FIRST_NAME		VARCHAR2(20)
LAST_NAME	NOT NULL	VARCHAR2(25)
EMAIL	NOT NULL	VARCHAR2(25)
PHONE_NUMBER		VARCHAR2(20)
HIRE_DATE	NOT NULL	DATE
JOB_ID	NOT NULL	VARCHAR2(10)
SALARY		NUMBER(8,2)
COMMISSION_PCT		NUMBER(2,2)
MANAGER_ID		NUMBER(6)
DEPARTMENT_ID		NUMBER(4)

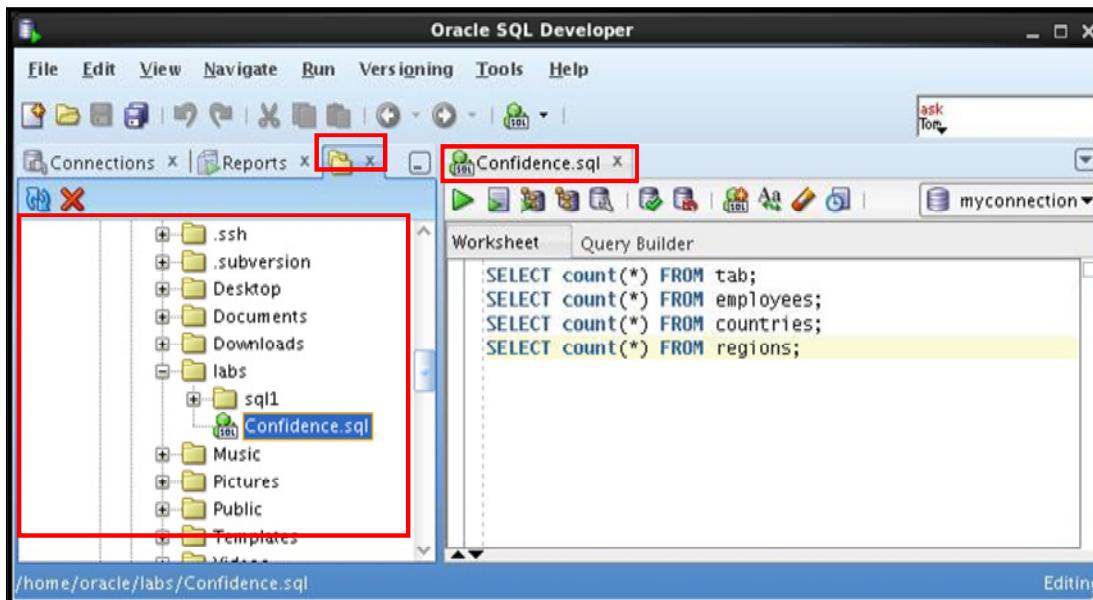

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In SQL Developer, you can also display the structure of a table using the DESCRIBE command. The result of the command is a display of column names and data types, as well as an indication if a column must contain data.

Browsing Files

Use the File Navigator to explore the file system and open system files.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

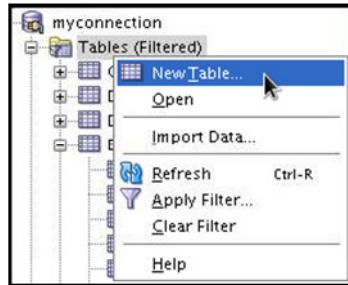

Browsing Database Objects

You can use the File Navigator to browse and open system files.

- To view the File Navigator, click the View tab and select Files, or select View > Files.
- To view the contents of a file, double-click a file name to display its contents in the SQL Worksheet area.

Creating a Schema Object

- SQL Developer supports the creation of any schema object by:
 - Executing a SQL statement in SQL Worksheet
 - Using the context menu
- Edit the objects by using an edit dialog box or one of the many context-sensitive menus.
- View the data definition language (DDL) for adjustments such as creating a new object or editing an existing schema object.

ORACLE

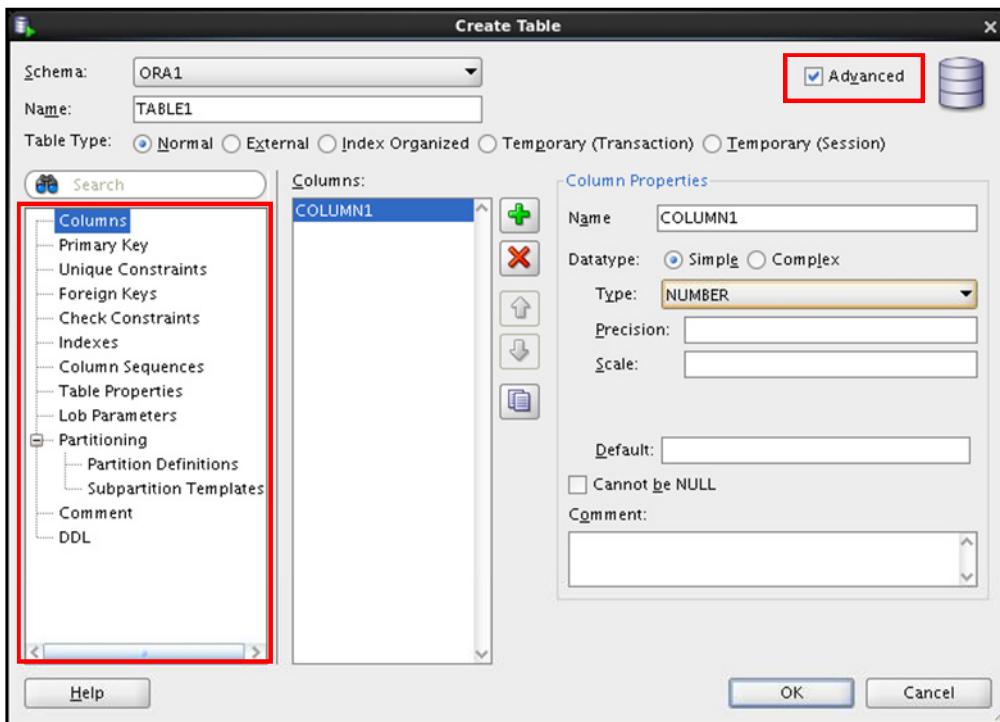

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL Developer supports the creation of any schema object by executing a SQL statement in SQL Worksheet. Alternatively, you can create objects by using the context menus. When created, you can edit objects using an edit dialog box or one of the many context-sensitive menus.

As new objects are created or existing objects are edited, the DDL for those adjustments is available for review. An Export DDL option is available if you want to create the full DDL for one or more objects in the schema.

The slide shows how to create a table using the context menu. To open a dialog box for creating a new table, right-click Tables and select New Table. The dialog boxes to create and edit database objects have multiple tabs, each reflecting a logical grouping of properties for that type of object.

Creating a New Table: Example

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the Create Table dialog box, if you do not select the Advanced check box, you can create a table quickly by specifying columns and some frequently-used features.

If you select the Advanced check box, the Create Table dialog box changes to one with multiple options, in which you can specify an extended set of features while you create the table.

The example in the slide shows how to create the `DEPENDENTS` table by selecting the Advanced check box.

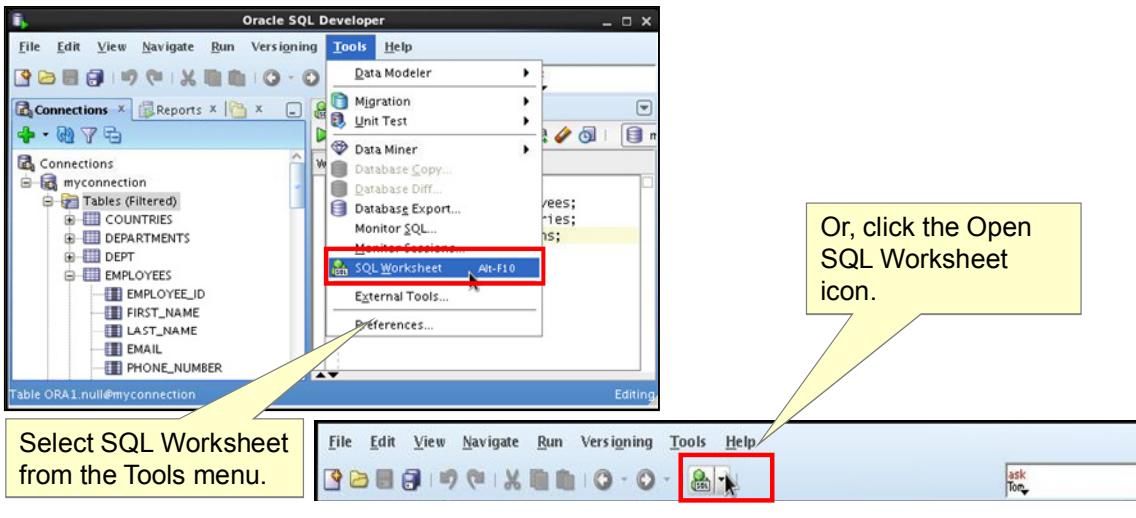

To create a new table, perform the following steps:

1. In the Connections Navigator, right-click Tables and select Create TABLE.
2. In the Create Table dialog box, select Advanced.
3. Specify the column information.
4. Click OK.

Although it is not required, you should also specify a primary key by using the Primary Key tab in the dialog box. Sometimes, you may want to edit the table that you have created; to do so, right-click the table in the Connections Navigator and select Edit.

Using the SQL Worksheet

- Use the SQL Worksheet to enter and execute SQL, PL/SQL, and SQL *Plus statements.
- Specify any actions that can be processed by the database connection associated with the worksheet.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When you connect to a database, a SQL Worksheet window for that connection automatically opens. You can use the SQL Worksheet to enter and execute SQL, PL/SQL, and SQL*Plus statements. The SQL Worksheet supports SQL*Plus statements to a certain extent. SQL*Plus statements that are not supported by the SQL Worksheet are ignored and not passed to the database.

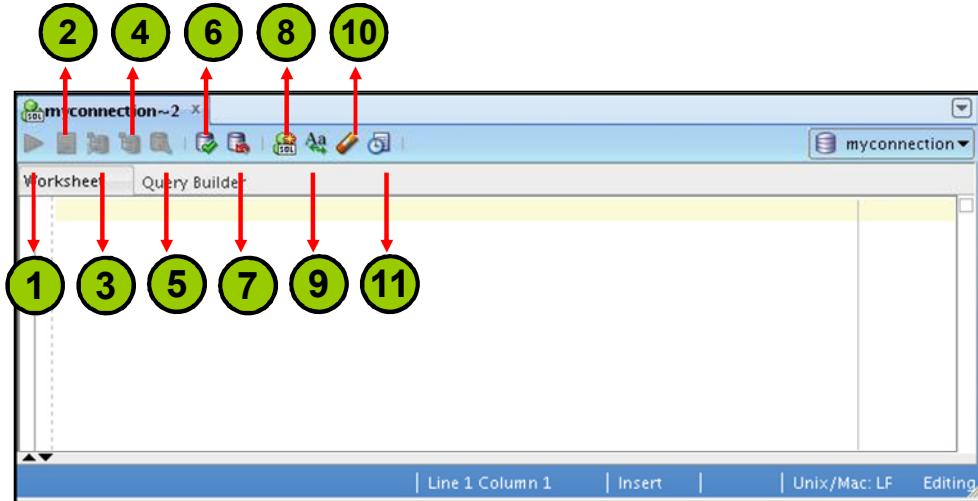

You can specify the actions that can be processed by the database connection associated with the worksheet, such as:

- Creating a table
- Inserting data
- Creating and editing a trigger
- Selecting data from a table
- Saving the selected data to a file

You can display a SQL Worksheet by using one of the following:

- Select Tools > SQL Worksheet.
- Click the Open SQL Worksheet icon.

Using the SQL Worksheet

The Oracle logo, consisting of the word 'ORACLE' in a red, sans-serif font.

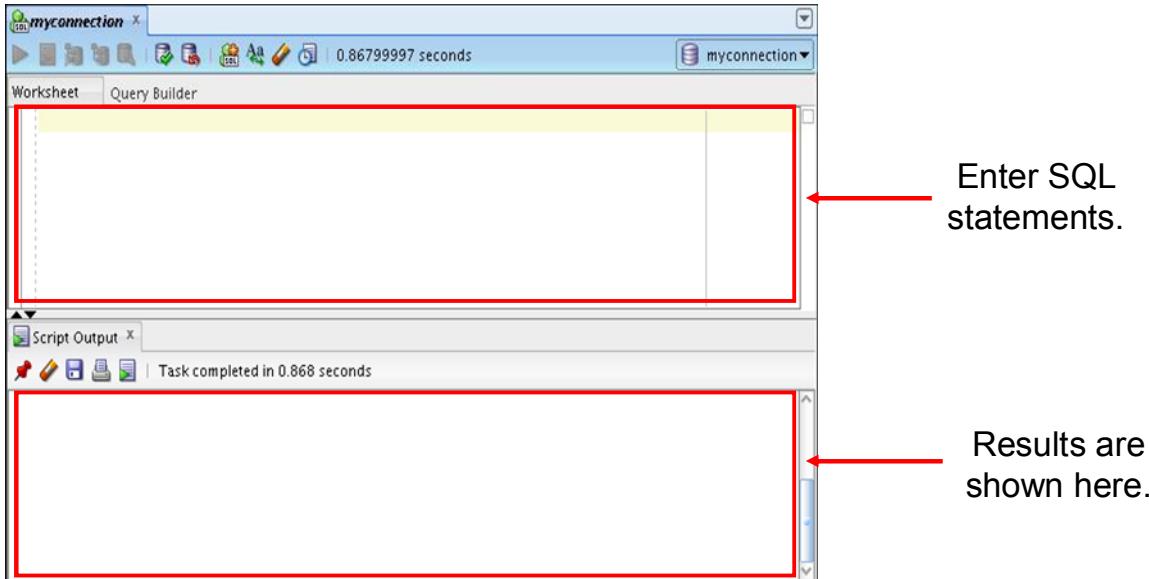

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You may want to use the shortcut keys or icons to perform certain tasks such as executing a SQL statement, running a script, and viewing the history of the SQL statements that you have executed. You can use the SQL Worksheet toolbar that contains icons to perform the following tasks:

1. **Run Statement:** Executes the statement where the cursor is located in the Enter SQL Statement box. You can use bind variables in the SQL statements, but not substitution variables.
2. **Run Script:** Executes all the statements in the Enter SQL Statement box by using the Script Runner. You can use substitution variables in the SQL statements, but not bind variables.
3. **Autotrace:** Generates trace information for the statement
4. **Explain Plan:** Generates the execution plan, which you can see by clicking the Explain tab
5. **SQL Tuning Advisory:** Analyzes high-volume SQL statements and offers tuning recommendations
6. **Commit:** Writes any changes to the database and ends the transaction
7. **Rollback:** Discards any changes to the database, without writing them to the database, and ends the transaction

8. **Unshared SQL Worksheet:** Creates a separate unshared SQL Worksheet for a connection
9. **To Upper/Lower/InitCap:** Changes the selected text to uppercase, lowercase, or initcap, respectively
10. **Clear:** Erases the statement or statements in the Enter SQL Statement box
11. **SQL History:** Displays a dialog box with information about the SQL statements that you have executed

Using the SQL Worksheet

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When you connect to a database, a SQL Worksheet window for that connection automatically opens. You can use the SQL Worksheet to enter and execute SQL, PL/SQL, and SQL*Plus statements. All SQL and PL/SQL commands are supported as they are passed directly from the SQL Worksheet to the Oracle database. The SQL*Plus commands that are used in SQL Developer must be interpreted by the SQL Worksheet before being passed to the database.

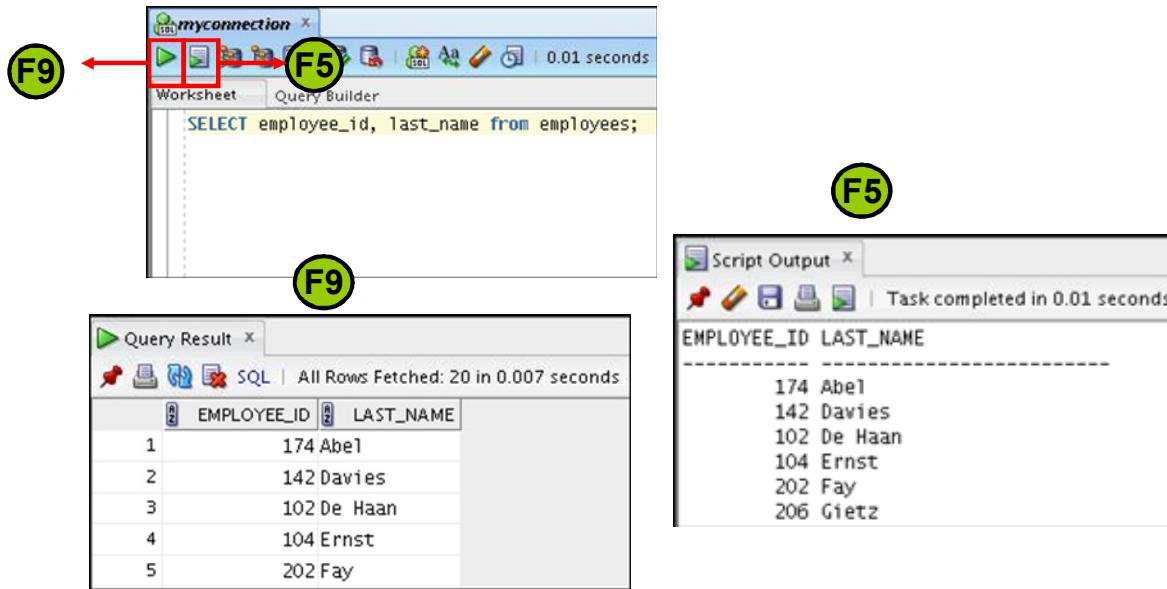

The SQL Worksheet currently supports a number of SQL*Plus commands. Commands that are not supported by the SQL Worksheet are ignored and not sent to the Oracle database. Through the SQL Worksheet, you can execute the SQL statements and some of the SQL*Plus commands.

You can display a SQL Worksheet by using any of the following options:

- Select Tools > SQL Worksheet.
- Click the Open SQL Worksheet icon.

Executing SQL Statements

Use the Enter SQL Statement box to enter single or multiple SQL statements.

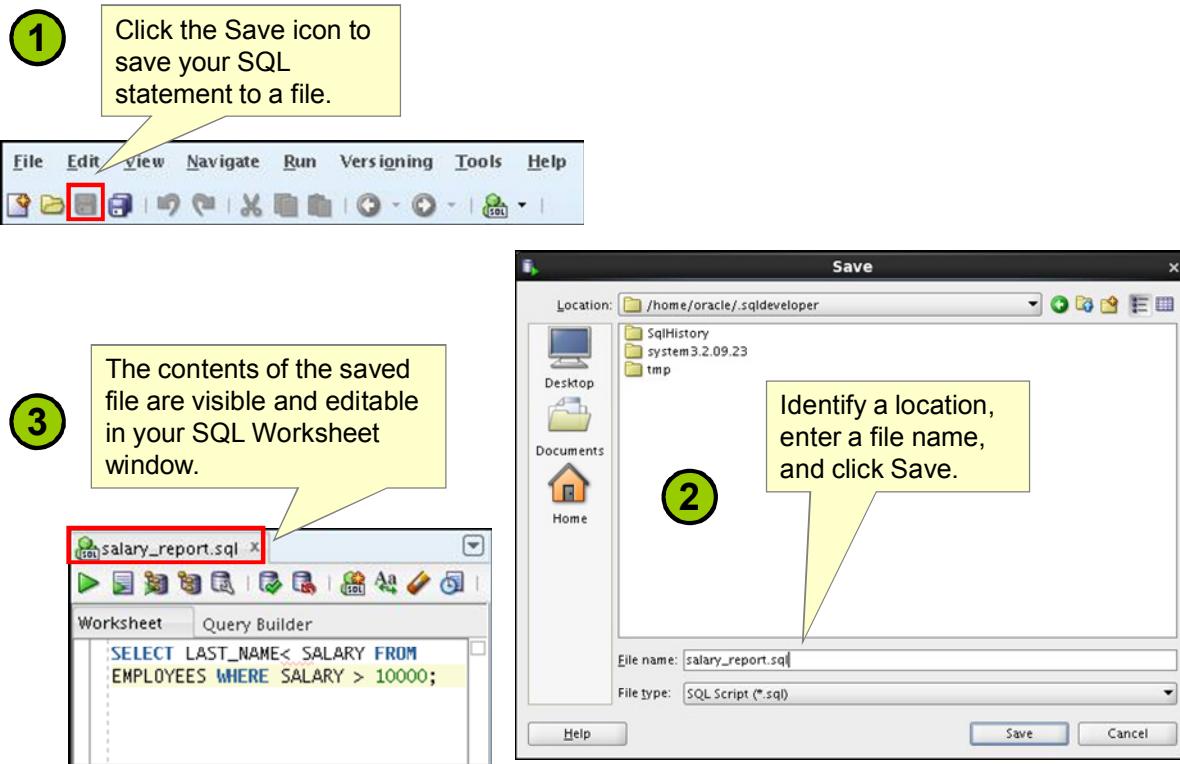

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide shows the difference in output for the same query when the F9 key or Execute Statement is used versus the output when F5 or Run Script is used.

Saving SQL Scripts

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

ORACLE

You can save your SQL statements from the SQL Worksheet to a text file. To save the contents of the Enter SQL Statement box, perform the following steps:

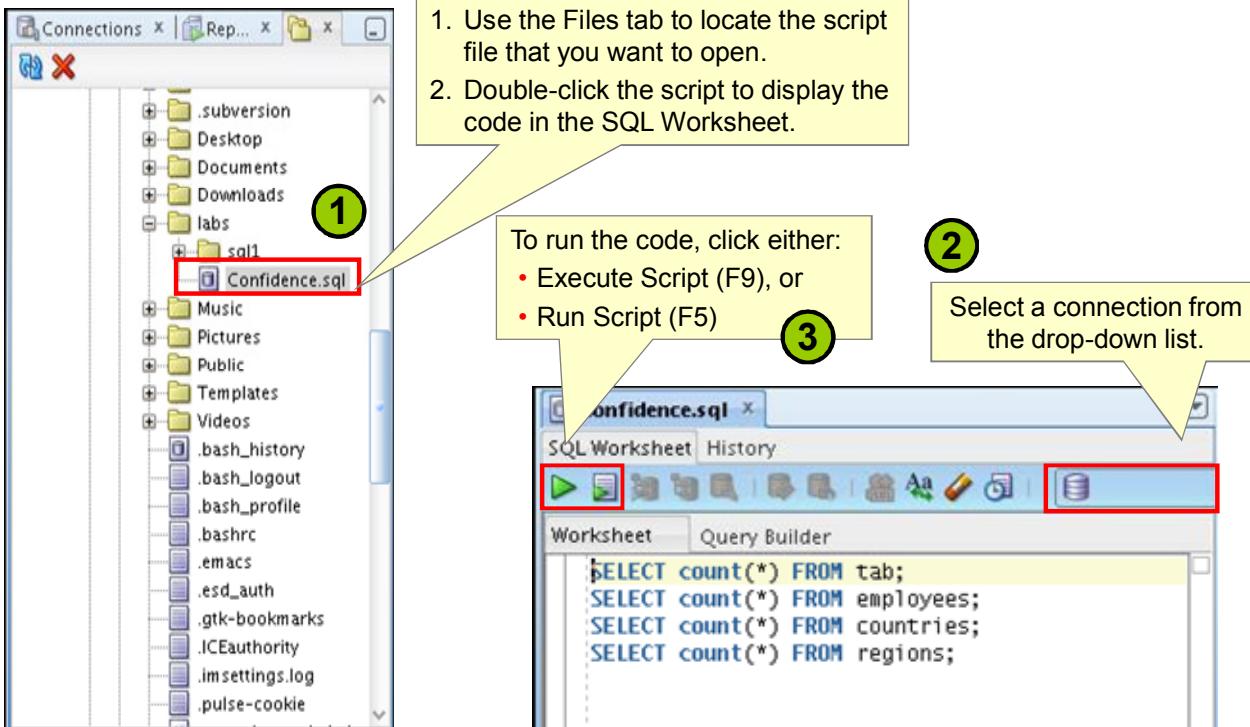

1. Click the Save icon or use the File > Save menu item.
2. In the Save dialog box, enter a file name and the location where you want the file saved.
3. Click Save.

After you save the contents to a file, the Enter SQL Statement window displays a tabbed page of your file contents. You can have multiple files open at the same time. Each file is displayed as a tabbed page.

Script Pathing

You can select a default path to look for scripts and to save scripts. Under Tools > Preferences > Database > Worksheet Parameters, enter a value in the “Select default path to look for scripts” field.

Executing Saved Script Files: Method 1

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

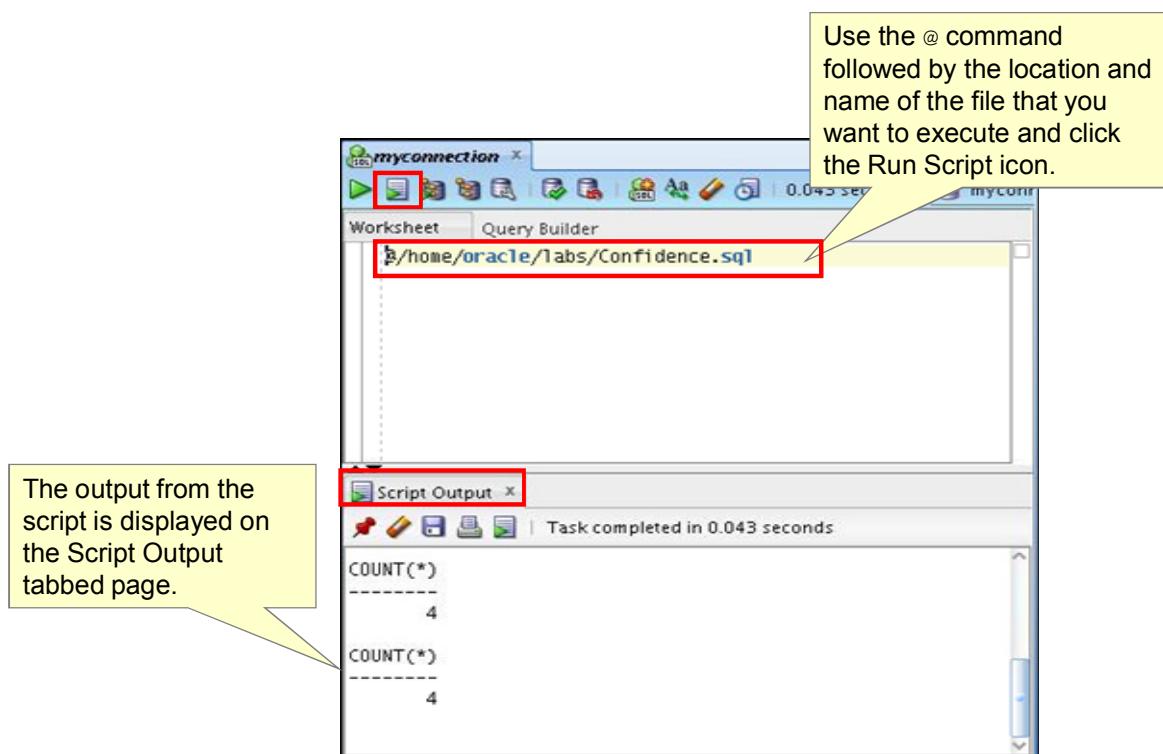

To open a script file and display the code in the SQL Worksheet area, perform the following steps:

1. In the files navigator, select (or navigate to) the script file that you want to open.
2. Double-click to open. The code of the script file is displayed in the SQL Worksheet area.
3. Select a connection from the connection drop-down list.
4. To run the code, click the Run Script (F5) icon on the SQL Worksheet toolbar. If you have not selected a connection from the connection drop-down list, a connection dialog box will appear. Select the connection that you want to use for the script execution.

Alternatively, you can also do the following:

1. Select File > Open. The Open dialog box is displayed.
2. In the Open dialog box, select (or navigate to) the script file that you want to open.
3. Click Open. The code of the script file is displayed in the SQL Worksheet area.
4. Select a connection from the connection drop-down list.
5. To run the code, click the Run Script (F5) icon on the SQL Worksheet toolbar. If you have not selected a connection from the connection drop-down list, a connection dialog box will appear. Select the connection that you want to use for the script execution.

Executing Saved Script Files: Method 2

ORACLE

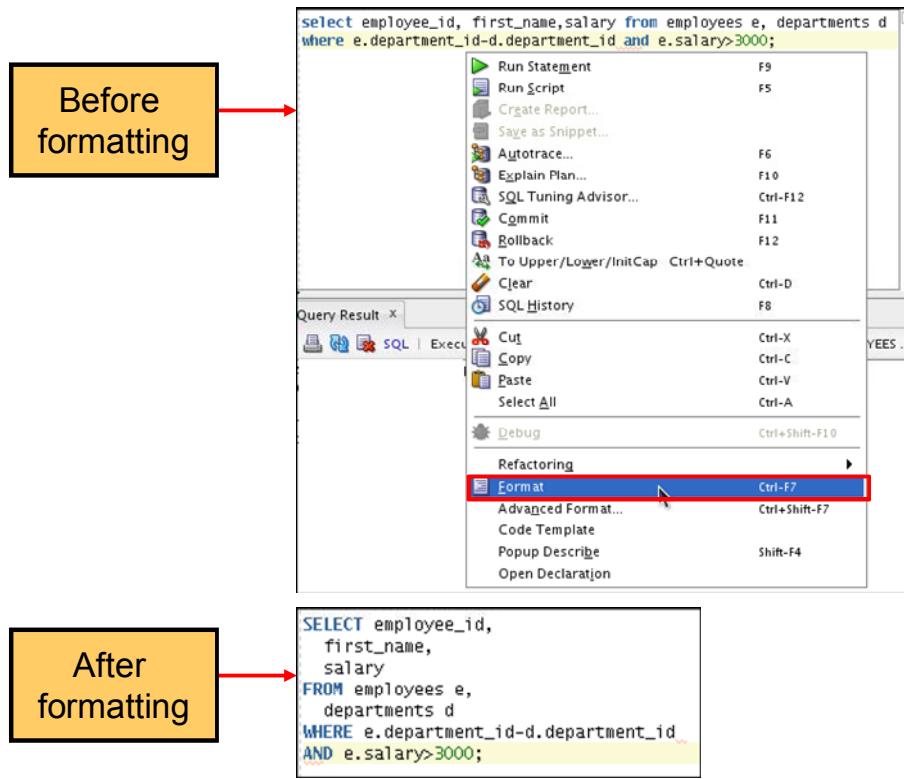

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

To run a saved SQL script, perform the following steps:

1. Use the @ command followed by the location and the name of the file that you want to run in the Enter SQL Statement window.
2. Click the Run Script icon.

The results from running the file are displayed on the Script Output tabbed page. You can also save the script output by clicking the Save icon on the Script Output tabbed page. The File Save dialog box appears and you can identify a name and location for your file.

Formatting the SQL Code

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

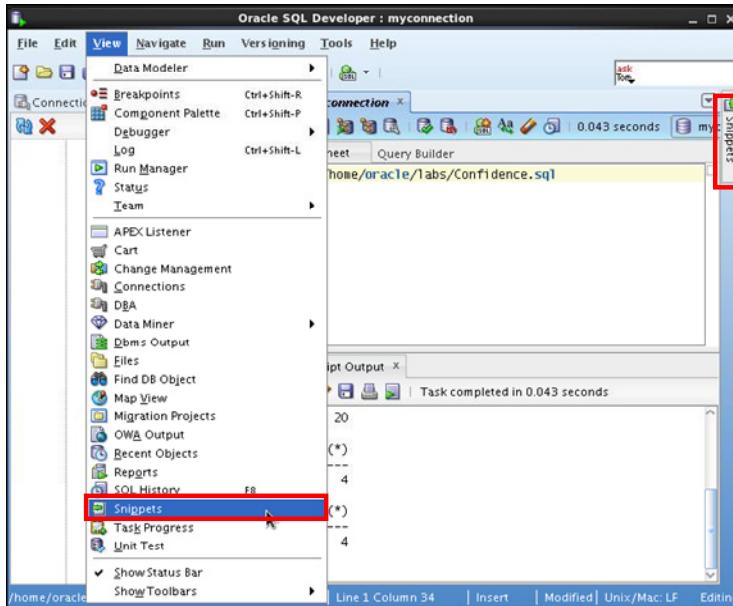

You may want to format the indentation, spacing, capitalization, and line separation of the SQL code. SQL Developer has a feature for formatting SQL code.

To format the SQL code, right-click in the statement area and select Format.

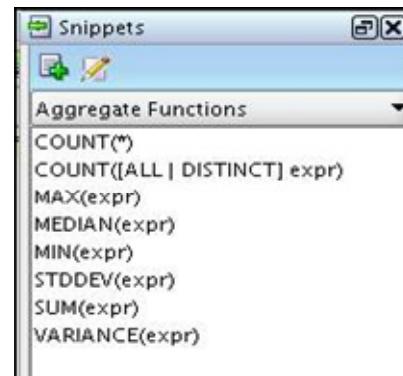

In the example in the slide, before formatting, the SQL code has the keywords not capitalized and the statement not properly indented. After formatting, the SQL code is beautified with the keywords capitalized and the statement properly indented.

Using Snippets

Snippets are code fragments that may be just syntax or examples.

When you place your cursor here, it shows the Snippets window. From the drop-down list, you can select the functions category that you want.

ORACLE

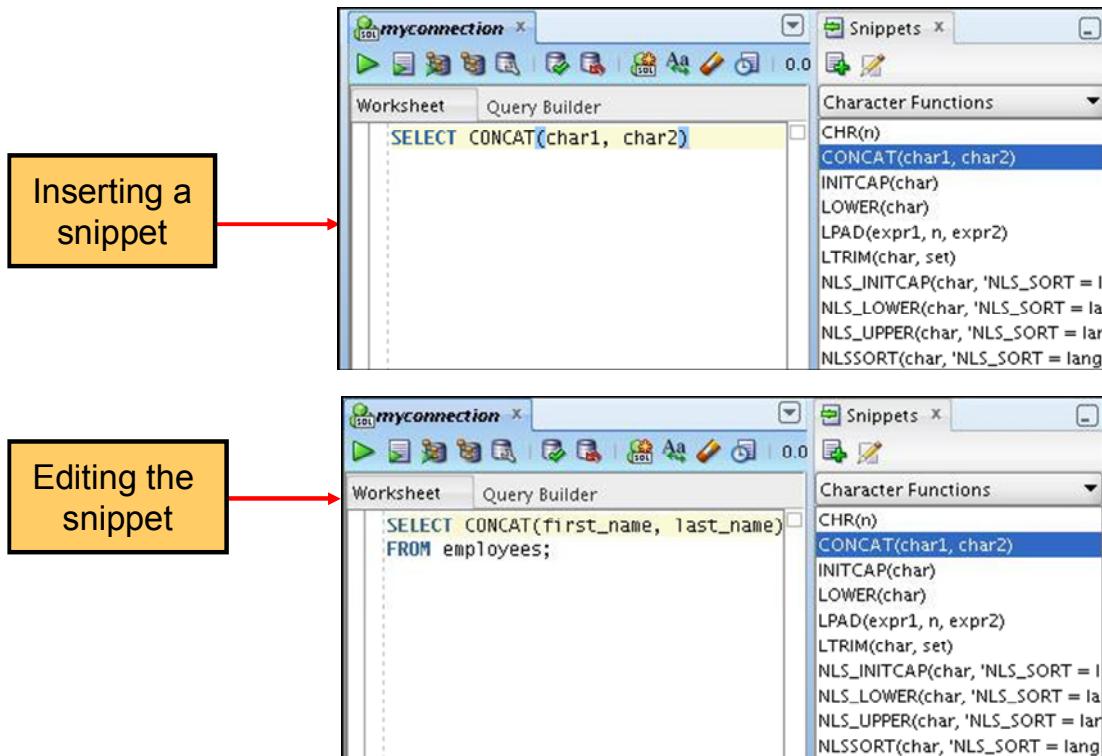

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You may want to use certain code fragments when you use the SQL Worksheet or create or edit a PL/SQL function or procedure. SQL Developer has a feature called Snippets. Snippets are code fragments such as SQL functions, optimizer hints, and miscellaneous PL/SQL programming techniques. You can drag snippets to the Editor window.

To display Snippets, select View > Snippets.

The Snippets window is displayed on the right. You can use the drop-down list to select a group. A Snippets button is placed in the right window margin, so that you can display the Snippets window if it becomes hidden.

Using Snippets: Example

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

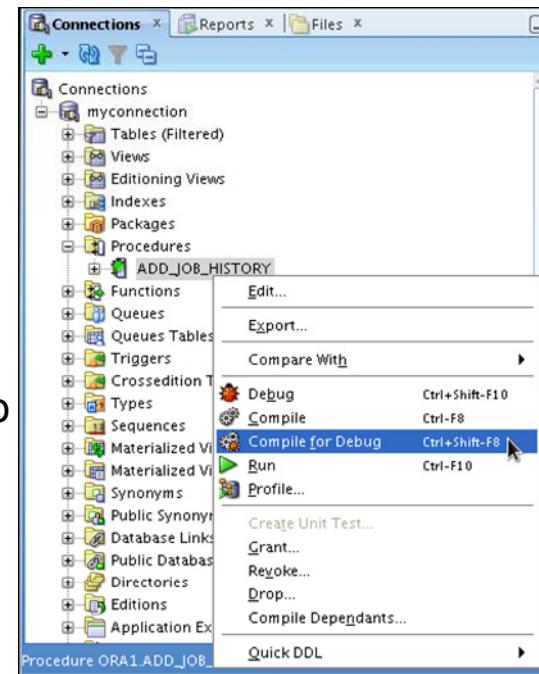

To insert a Snippet into your code in a SQL Worksheet or in a PL/SQL function or procedure, drag the snippet from the Snippets window to the desired place in your code. Then you can edit the syntax so that the SQL function is valid in the current context. To see a brief description of a SQL function in a tool tip, place the cursor over the function name.

The example in the slide shows that `CONCAT (char1, char2)` is dragged from the Character Functions group in the Snippets window. Then the `CONCAT` function syntax is edited and the rest of the statement is added as in the following:

```
SELECT CONCAT(first_name, last_name)
FROM employees;
```

Debugging Procedures and Functions

- Use SQL Developer to debug PL/SQL functions and procedures.
- Use the Compile for Debug option to perform a PL/SQL compilation so that the procedure can be debugged.
- Use the Debug menu options to set breakpoints, and to perform step into, step over tasks.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In SQL Developer, you can debug PL/SQL procedures and functions. Using the Debug menu options, you can perform the following debugging tasks:

- **Find Execution Point** goes to the next execution point.
- **Resume** continues execution.
- **Step Over** bypasses the next method and goes to the next statement after the method.
- **Step Into** goes to the first statement in the next method.
- **Step Out** leaves the current method and goes to the next statement.
- **Step to End of Method** goes to the last statement of the current method.
- **Pause** halts execution, but does not exit, thus allowing you to resume execution.
- **Terminate** halts and exits the execution. You cannot resume execution from this point; instead, to start running or debugging from the beginning of the function or procedure, click the Run or Debug icon on the Source tab toolbar.
- **Garbage Collection** removes invalid objects from the cache in favor of more frequently accessed and more valid objects.

These options are also available as icons on the Debugging tab of the output window.

Database Reporting

SQL Developer provides a number of predefined reports about the database and its objects.

Owner	Name	Type	Referenced_Owner	Referenced_Name	Referenced_Type
APEX_040100	APEX	PROCEDURE	APEX_040100	WW_FLOW	PACKAGE
APEX_040100	APEX	PROCEDURE	APEX_040100	WW_FLOW_ISC	PACKAGE
APEX_040100	APEX	PROCEDURE	APEX_040100	WW_FLOW_SECURITY	PACKAGE
APEX_040100	APEX	PROCEDURE	SYS	STANDARD	PACKAGE
APEX_040100	APEX	PROCEDURE	SYS	SYS_STUB_FOR_PURITY_ANALYSIS	PACKAGE
APEX_040100	APEXWS	PACKAGE	SYS	STANDARD	PACKAGE
APEX_040100	APEXADMIN	PROCEDURE	APEX_040100	F	PROCEDURE
APEX_040100	APEX_ADMIN	PROCEDURE	SYS	STANDARD	PACKAGE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	NV	FUNCTION
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOWS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_APPLICATION_GROUPS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_AUTHENTICATIONS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_COMPANIES	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_COMPANY_SCHEMAS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_COMPUTATIONS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_ICON_BAR	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_INSTALL_SCRIPTS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_ITEMS	TABLE
APEX_040100	APEX_APPLICATIONS	VIEW	APEX_040100	WW_FLOW_LANGUAGE_MAP	TABLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

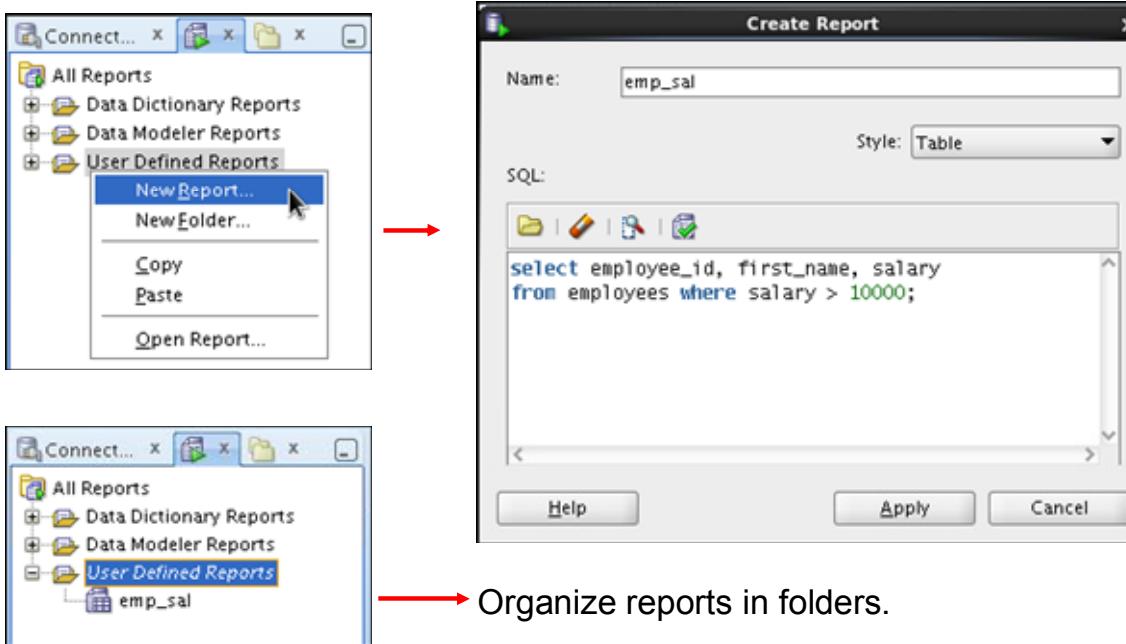

SQL Developer provides many reports about the database and its objects. These reports can be grouped into the following categories:

- About Your Database reports
- Database Administration reports
- Table reports
- PL/SQL reports
- Security reports
- XML reports
- Jobs reports
- Streams reports
- All Objects reports
- Data Dictionary reports
- User-Defined reports

To display reports, click the Reports tab on the left of the window. Individual reports are displayed in tabbed panes on the right of the window; and for each report, you can select (using a drop-down list) the database connection for which to display the report. For reports about objects, the objects shown are only those visible to the database user associated with the selected database connection, and the rows are usually ordered by the Owner. You can also create your own user-defined reports.

Creating a User-Defined Report

Create and save user-defined reports for repeated use.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

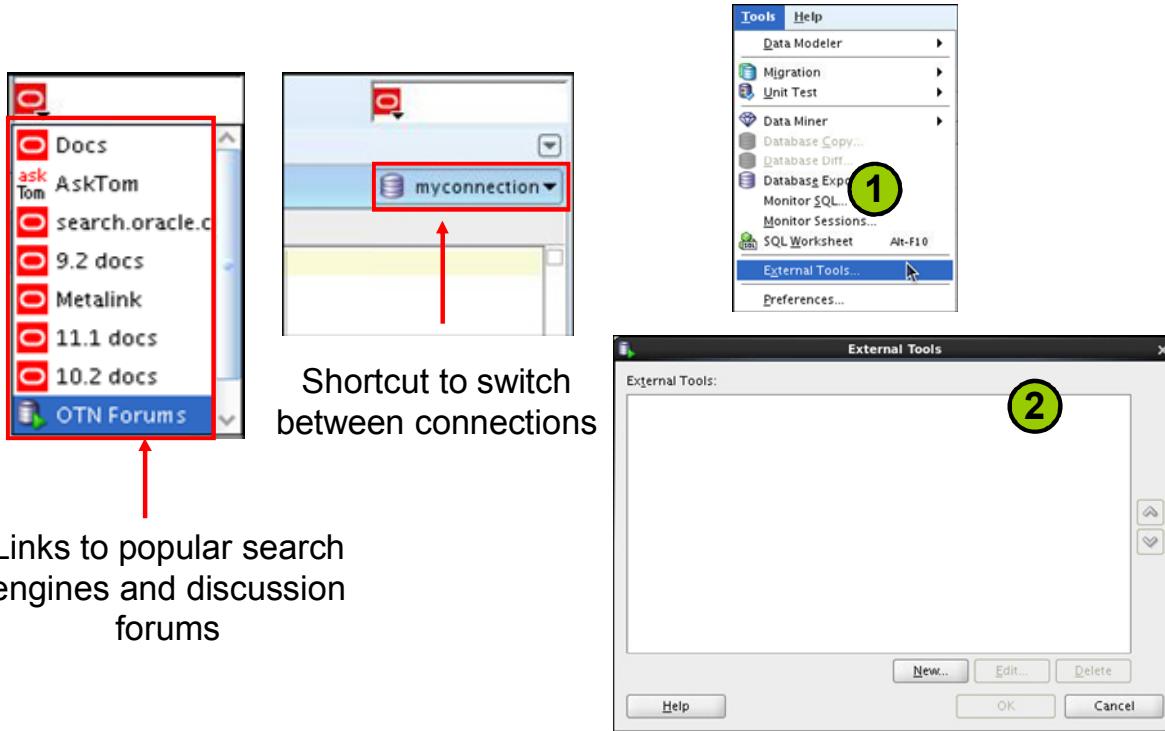

User-defined reports are reports created by SQL Developer users. To create a user-defined report, perform the following steps:

1. Right-click the User Defined Reports node under Reports and select Add Report.
2. In the Create Report dialog box, specify the report name and the SQL query to retrieve information for the report. Then click Apply.

In the example in the slide, the report name is specified as `emp_sal`. An optional description is provided indicating that the report contains details of employees with `salary >= 10000`. The complete SQL statement for retrieving the information to be displayed in the user-defined report is specified in the SQL box. You can also include an optional tool tip to be displayed when the cursor stays briefly over the report name in the Reports navigator display.

You can organize user-defined reports in folders and you can create a hierarchy of folders and subfolders. To create a folder for user-defined reports, right-click the User Defined Reports node or any folder name under that node and select Add Folder. Information about user-defined reports, including any folders for these reports, is stored in a file named `UserReports.xml` in the directory for user-specific information.

Search Engines and External Tools

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

ORACLE

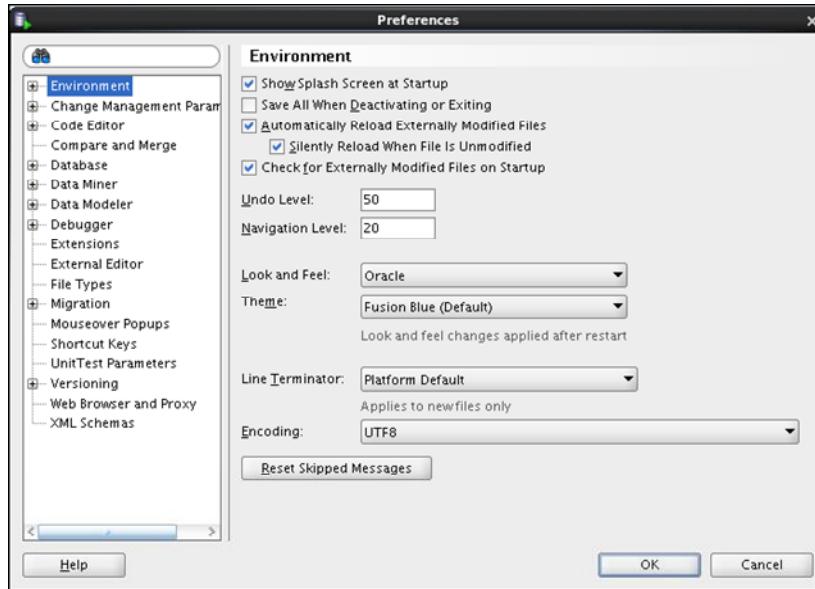

To enhance the productivity of developers, SQL Developer has added quick links to popular search engines and discussion forums such as AskTom, Google, and so on. Also, you have shortcut icons to some of the frequently-used tools such as Notepad, Microsoft Word, and Dreamweaver, available to you.

You can add external tools to the existing list or even delete shortcuts to the tools that you do not use frequently. To do so, perform the following steps:

1. From the Tools menu, select External Tools.
2. In the External Tools dialog box, select New to add new tools. Select Delete to remove any tool from the list.

Setting Preferences

- Customize the SQL Developer interface and environment.
- In the Tools menu, select Preferences.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

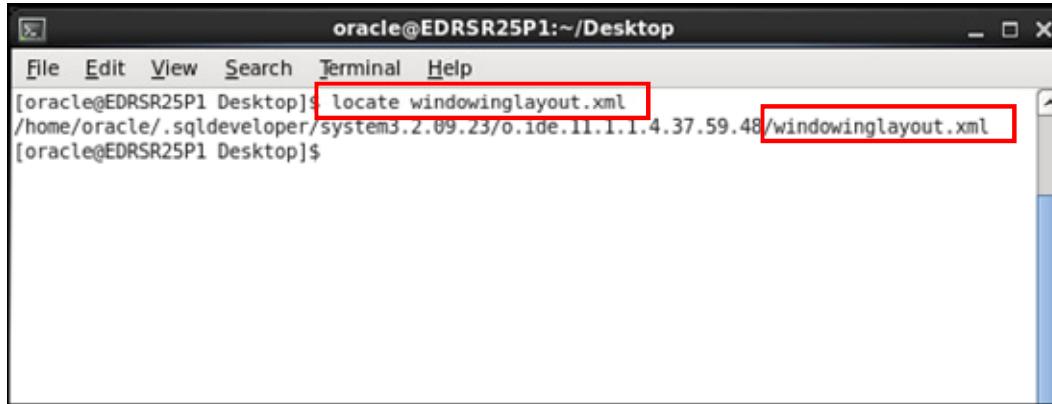

You can customize many aspects of the SQL Developer interface and environment by modifying SQL Developer preferences according to your needs. To modify SQL Developer preferences, select Tools, and then Preferences.

The preferences are grouped into the following categories:

- Environment
- Change Management parameter
- Code Editors
- Compare and Merge
- Database
- Data Miner
- Data Modeler
- Debugger
- Extensions
- External Editor
- File Types
- Migration

- Mouseover Popups
- Shortcut Keys
- Unit Test Parameters
- Versioning
- Web Browser and Proxy
- XML Schemas

Resetting the SQL Developer Layout

A screenshot of a terminal window titled "oracle@EDRSR25P1:~/Desktop". The window shows the command "locate windowinglayout.xml" being run, and the output is "/home/oracle/.sqldeveloper/system3.2.09.23/o.ide.11.1.1.4.37.59.48/windowinglayout.xml". The line containing the file path is highlighted with a red rectangle.

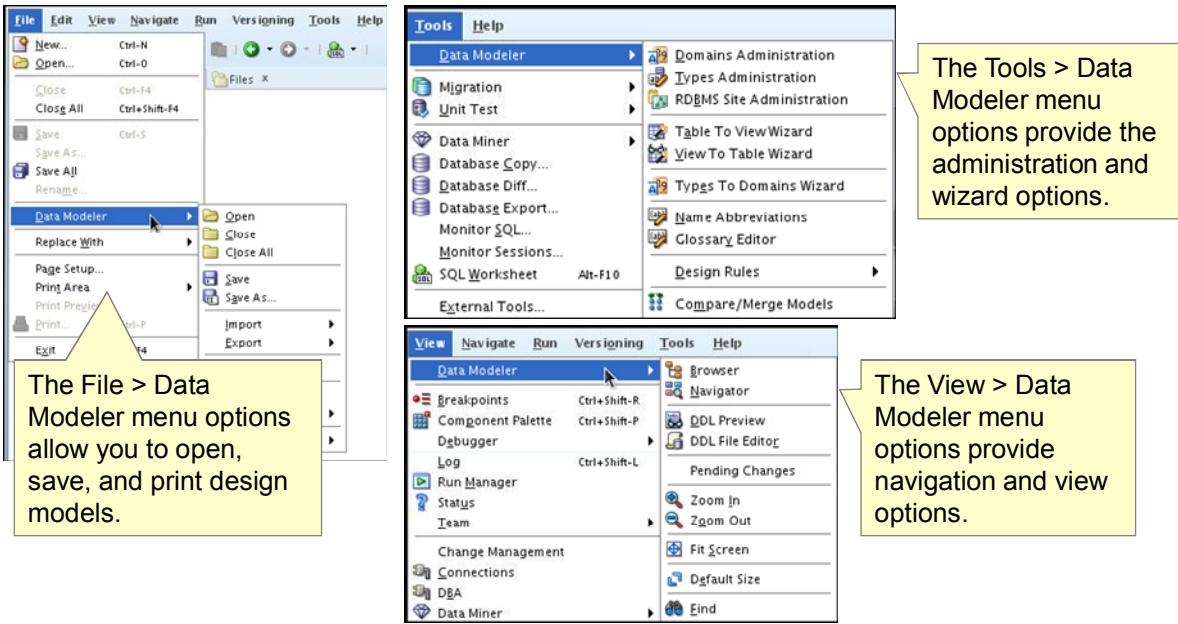

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

While working with SQL Developer, if the Connections Navigator disappears or if you cannot dock the Log window in its original place, perform the following steps to fix the problem:

1. Exit from SQL Developer.
2. Open a terminal window and use the locate command to find the location of `windowinglayout.xml`.
3. Go to the directory that has `windowinglayout.xml` and delete it.
4. Restart SQL Developer.

Data Modeler in SQL Developer

SQL Developer includes an integrated version of SQL Developer Data Modeler.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Using the integrated version of the SQL Developer Data Modeler, you can:

- Create, open, import, and save a database design
- Create, modify, and delete Data Modeler objects

To display Data Modeler in a pane, click Tools, and then Data Modeler. The Data Modeler menu under Tools includes additional commands, for example, that enable you to specify design rules and preferences.

Summary

In this appendix, you should have learned how to use SQL Developer to do the following:

- Browse, create, and edit database objects
- Execute SQL statements and scripts in SQL Worksheet
- Create and save custom reports
- Browse the Data Modeling options in SQL Developer

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL Developer is a free graphical tool to simplify database development tasks. Using SQL Developer, you can browse, create, and edit database objects. You can use SQL Worksheet to run SQL statements and scripts. SQL Developer enables you to create and save your own special set of reports for repeated use.

Using SQL*Plus

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this appendix, you should be able to do the following:

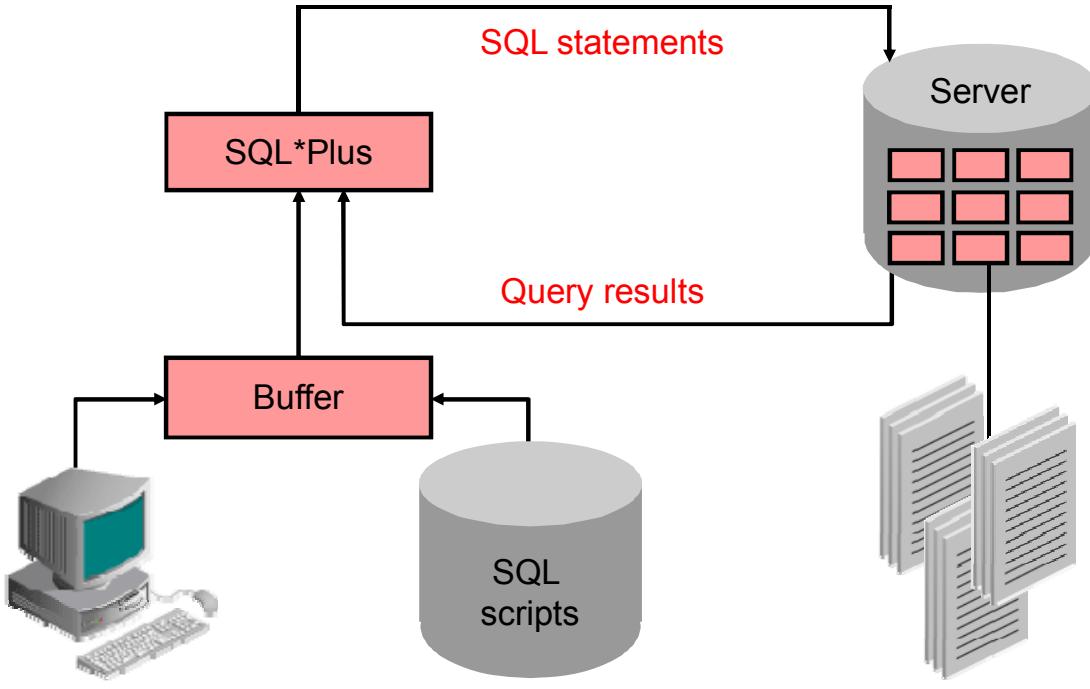

- Log in to SQL*Plus
- Edit SQL commands
- Format the output by using SQL*Plus commands
- Interact with script files

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You might want to create `SELECT` statements that can be used repeatedly. This appendix covers the use of SQL*Plus commands to execute SQL statements. You learn how to format the output by using SQL*Plus commands, edit SQL commands, and save scripts in SQL*Plus.

SQL and SQL*Plus Interaction

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL and SQL*Plus

SQL is a command language that is used for communication with the Oracle server from any tool or application. Oracle SQL contains many extensions. When you enter a SQL statement, it is stored in a part of memory called the *SQL buffer* and remains there until you enter a new SQL statement. SQL*Plus is an Oracle tool that recognizes and submits SQL statements to the Oracle9i Server for execution. It contains its own command language.

Features of SQL

- Can be used by a range of users, including those with little or no programming experience
- Is a nonprocedural language
- Reduces the amount of time required for creating and maintaining systems
- Is an English-like language

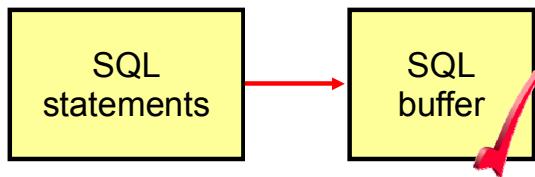

Features of SQL*Plus

- Accepts ad hoc entry of statements
- Accepts SQL input from files
- Provides a line editor for modifying SQL statements
- Controls environmental settings
- Formats query results into basic reports
- Accesses local and remote databases

SQL Statements Versus SQL*Plus Commands

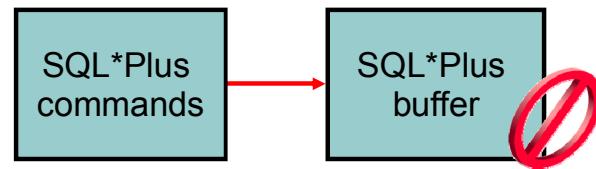

SQL

- A language
- ANSI-standard
- Keywords cannot be abbreviated.
- Statements manipulate data and table definitions in the database.

SQL*Plus

- An environment
- Oracle-proprietary
- Keywords can be abbreviated.
- Commands do not allow manipulation of values in the database.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The following table compares SQL and SQL*Plus:

SQL	SQL*Plus
Is a language for communicating with the Oracle server to access data	Recognizes SQL statements and sends them to the server
Is based on American National Standards Institute (ANSI)-standard SQL	Is the Oracle-proprietary interface for executing SQL statements
Manipulates data and table definitions in the database	Does not allow manipulation of values in the database
Is entered into the SQL buffer on one or more lines	Is entered one line at a time, not stored in the SQL buffer
Does not have a continuation character	Uses a dash (-) as a continuation character if the command is longer than one line
Cannot be abbreviated	Can be abbreviated
Uses a termination character to execute commands immediately	Does not require termination characters; executes commands immediately
Uses functions to perform some formatting	Uses commands to format data

Overview of SQL*Plus

- Log in to SQL*Plus.
- Describe the table structure.
- Edit your SQL statement.
- Execute SQL from SQL*Plus.
- Save SQL statements to files and append SQL statements to files.
- Execute saved files.
- Load commands from the file to buffer to edit.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL*Plus

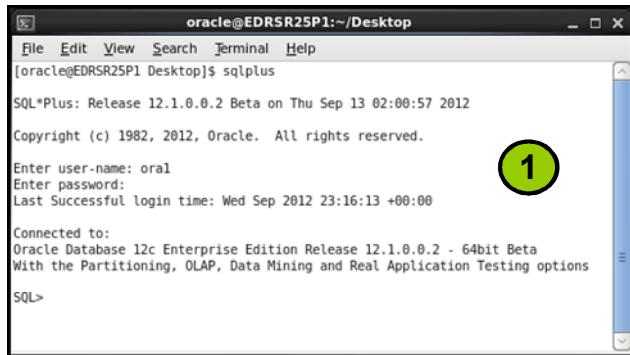

SQL*Plus is an environment in which you can:

- Execute SQL statements to retrieve, modify, add, and remove data from the database
- Format, perform calculations on, store, and print query results in the form of reports
- Create script files to store SQL statements for repeated use in the future

SQL*Plus commands can be divided into the following main categories:

Category	Purpose
Environment	Affect the general behavior of SQL statements for the session
Format	Format query results
File manipulation	Save, load, and run script files
Execution	Send SQL statements from the SQL buffer to the Oracle server
Edit	Modify SQL statements in the buffer
Interaction	Create and pass variables to SQL statements, print variable values, and print messages to the screen
Miscellaneous	Connect to the database, manipulate the SQL*Plus environment, and display column definitions

Logging In to SQL*Plus

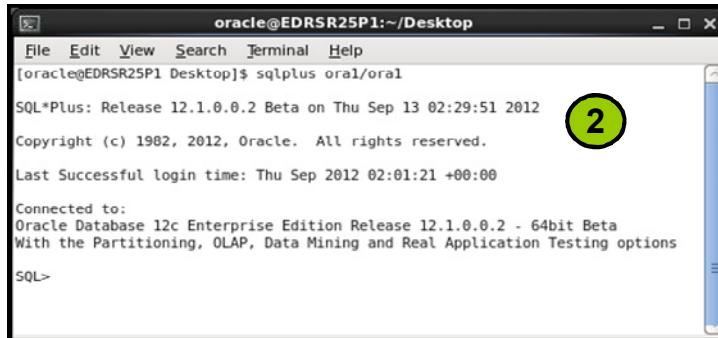

```
oracle@EDRSR25P1:~/Desktop
[oracle@EDRSR25P1 Desktop]$ sqlplus
SQL*Plus: Release 12.1.0.0.2 Beta on Thu Sep 13 02:00:57 2012
Copyright (c) 1982, 2012, Oracle. All rights reserved.

```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

How you invoke SQL*Plus depends on the type of operating system that you are running Oracle Database on.

To log in from a Linux environment, perform the following steps:

1. Right-click your Linux desktop and select terminal.
2. Enter the `sqlplus` command shown in the slide.
3. Enter the username, password, and database name.

In the syntax:

<code>username</code>	Your database username
<code>password</code>	Your database password (Your password is visible if you enter it here.)
<code>@database</code>	The database connect string

Note: To ensure the integrity of your password, do not enter it at the operating system prompt. Instead, enter only your username. Enter your password at the password prompt.

Displaying the Table Structure

Use the SQL*Plus DESCRIBE command to display the structure of a table:

```
DESC [RIBE] tablename
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In SQL*Plus, you can display the structure of a table using the DESCRIBE command. The result of the command is a display of column names and data types, as well as an indication if a column must contain data.

In the syntax:

tablename The name of any existing table, view, or synonym that is accessible to the user

To describe the DEPARTMENTS table, use the following command:

```
SQL> DESCRIBE DEPARTMENTS
      Name          Null    Type
----- -----
DEPARTMENT_ID           NOT NULL NUMBER(4)
DEPARTMENT_NAME         NOT NULL VARCHAR2(30)
MANAGER_ID                NUMBER(6)
LOCATION_ID                 NUMBER(4)
```

Displaying the Table Structure

```
DESCRIBE departments
```

Name	Null	Type
DEPARTMENT_ID	NOT NULL	NUMBER (4)
DEPARTMENT_NAME	NOT NULL	VARCHAR2 (30)
MANAGER_ID		NUMBER (6)
LOCATION_ID		NUMBER (4)

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide displays information about the structure of the DEPARTMENTS table.
In the result:

Null: Specifies whether a column must contain data (NOT NULL indicates that a column must contain data.)

Type: Displays the data type for a column

SQL*Plus Editing Commands

- A [PPEND] *text*
- C [HANGE] / *old* / *new*
- C [HANGE] / *text* /
- CL [EAR] BUFF [ER]
- DEL
- DEL *n*
- DEL *m n*

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL*Plus commands are entered one line at a time and are not stored in the SQL buffer.

Command	Description
A [PPEND] <i>text</i>	Adds <i>text</i> to the end of the current line
C [HANGE] / <i>old</i> / <i>new</i>	Changes <i>old</i> text to <i>new</i> in the current line
C [HANGE] / <i>text</i> /	Deletes <i>text</i> from the current line
CL [EAR] BUFF [ER]	Deletes all lines from the SQL buffer
DEL	Deletes current line
DEL <i>n</i>	Deletes line <i>n</i>
DEL <i>m n</i>	Deletes lines <i>m</i> to <i>n</i> inclusive

Guidelines

- If you press Enter before completing a command, SQL*Plus prompts you with a line number.
- You terminate the SQL buffer either by entering one of the terminator characters (semicolon or slash) or by pressing Enter twice. The SQL prompt appears.

SQL*Plus Editing Commands

- I [NPUT]
- I [NPUT] *text*
- L [IST]
- L [IST] *n*
- L [IST] *m n*
- R [UN]
- *n*
- *n text*
- 0 *text*

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Command	Description
I [NPUT]	Inserts an indefinite number of lines
I [NPUT] <i>text</i>	Inserts a line consisting of <i>text</i>
L [IST]	Lists all lines in the SQL buffer
L [IST] <i>n</i>	Lists one line (specified by <i>n</i>)
L [IST] <i>m n</i>	Lists a range of lines (<i>m</i> to <i>n</i>) inclusive
R [UN]	Displays and runs the current SQL statement in the buffer
<i>n</i>	Specifies the line to make the current line
<i>n text</i>	Replaces line <i>n</i> with <i>text</i>
0 <i>text</i>	Inserts a line before line 1

Note: You can enter only one SQL*Plus command for each SQL prompt. SQL*Plus commands are not stored in the buffer. To continue a SQL*Plus command on the next line, end the first line with a hyphen (-).

Using LIST, n, and APPEND

```
LIST
 1  SELECT last_name
 2* FROM employees
```

```
1
1* SELECT last_name
```

```
A , job_id
1* SELECT last_name, job_id
```

```
LIST
 1  SELECT last_name, job_id
 2* FROM employees
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- Use the L [IST] command to display the contents of the SQL buffer. The asterisk (*) beside line 2 in the buffer indicates that line 2 is the current line. Any edits that you made apply to the current line.
- Change the number of the current line by entering the number (n) of the line that you want to edit. The new current line is displayed.
- Use the A [PPEND] command to add text to the current line. The newly edited line is displayed. Verify the new contents of the buffer by using the LIST command.

Note: Many SQL*Plus commands, including LIST and APPEND, can be abbreviated to just their first letter. LIST can be abbreviated to L; APPEND can be abbreviated to A.

Using the CHANGE Command

```
LIST  
1* SELECT * from employees
```

```
c/employees/departments  
1* SELECT * from departments
```

```
LIST  
1* SELECT * from departments
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

- Use `L [IST]` to display the contents of the buffer.
- Use the `C [HANGE]` command to alter the contents of the current line in the SQL buffer. In this case, replace the `employees` table with the `departments` table. The new current line is displayed.
- Use the `L [IST]` command to verify the new contents of the buffer.

SQL*Plus File Commands

- `SAVE filename`
- `GET filename`
- `START filename`
- `@ filename`
- `EDIT filename`
- `SPOOL filename`
- `EXIT`

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL statements communicate with the Oracle server. SQL*Plus commands control the environment, format query results, and manage files. You can use the commands described in the following table:

Command	Description
<code>SAV[E] filename [.ext] [REP[LACE] APP[END]]</code>	Saves the current contents of the SQL buffer to a file. Use APPEND to add to an existing file; use REPLACE to overwrite an existing file. The default extension is .sql.
<code>GET filename [.ext]</code>	Writes the contents of a previously saved file to the SQL buffer. The default extension for the file name is .sql.
<code>STA[RT] filename [.ext]</code>	Runs a previously saved command file
<code>@ filename</code>	Runs a previously saved command file (same as START)
<code>ED[IT]</code>	Invokes the editor and saves the buffer contents to a file named afiedt.buf
<code>ED[IT] [filename [.ext]]</code>	Invokes the editor to edit the contents of a saved file
<code>SPO[OL] [filename [.ext]] OFF OUT</code>	Stores query results in a file. OFF closes the spool file. OUT closes the spool file and sends the file results to the printer.
<code>EXIT</code>	Quits SQL*Plus

Using the **SAVE**, **START** Commands

```
LIST
```

```
1  SELECT last_name, manager_id, department_id  
2* FROM employees
```

```
SAVE my_query
```

```
Created file my_query
```

```
START my_query
```

LAST_NAME	MANAGER_ID	DEPARTMENT_ID
King		90
Kochhar	100	90
...		
107 rows selected.		

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SAVE

Use the **SAVE** command to store the current contents of the buffer in a file. Thus, you can store frequently-used scripts for use in the future.

START

Use the **START** command to run a script in SQL*Plus. You can also, alternatively, use the symbol @ to run a script.

```
@my_query
```

SERVEROUTPUT Command

- Use the SET SERVEROUT [PUT] command to control whether to display the output of stored procedures or PL/SQL blocks in SQL*Plus.
- The DBMS_OUTPUT line length limit is increased from 255 bytes to 32767 bytes.
- The default size is now unlimited.
- Resources are not preallocated when SERVEROUTPUT is set.
- Because there is no performance penalty, use UNLIMITED unless you want to conserve physical memory.

```
SET SERVEROUT [PUT] {ON | OFF} [SIZE {n | UNL [IMITED]}]
[FOR [MAT] {WRA [PPED] | WOR [D_WWRAPPED] | TRU [NCATED]}]
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Most of the PL/SQL programs perform input and output through SQL statements, to store data in database tables or query those tables. All other PL/SQL input/output is done through APIs that interact with other programs. For example, the DBMS_OUTPUT package has procedures, such as PUT_LINE. To see the result outside of PL/SQL requires another program, such as SQL*Plus, to read and display the data passed to DBMS_OUTPUT.

SQL*Plus does not display DBMS_OUTPUT data unless you first issue the SQL*Plus command SET SERVEROUTPUT ON as follows:

```
SET SERVEROUTPUT ON
```

Note

- SIZE sets the number of bytes of the output that can be buffered within the Oracle Database server. The default is UNLIMITED. n cannot be less than 2000 or greater than 1,000,000.
- For additional information about SERVEROUTPUT, see *Oracle Database PL/SQL User's Guide and Reference 12c*.

Using the SQL*Plus SPOOL Command

```
SPO [OL] [file_name [.ext]] [CRE [ATE] | REP [LACE] |
APP [END]] | OFF | OUT]
```

Option	Description
file_name [.ext]	Spools output to the specified file name
CRE [ATE]	Creates a new file with the name specified
REP [LACE]	Replaces the contents of an existing file. If the file does not exist, REPLACE creates the file.
APP [END]	Adds the contents of the buffer to the end of the file that you specify
OFF	Stops spooling
OUT	Stops spooling and sends the file to your computer's standard (default) printer

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The SPOOL command stores query results in a file or optionally sends the file to a printer. The SPOOL command has been enhanced. You can now append to, or replace an existing file, where previously you could use SPOOL only to create (and replace) a file. REPLACE is the default.

To spool the output generated by commands in a script without displaying the output on screen, use SET TERMOUT OFF. SET TERMOUT OFF does not affect the output from commands that run interactively.

You must use quotation marks around file names that contain white space. To create a valid HTML file using SPOOL APPEND commands, you must use PROMPT or a similar command to create the HTML page header and footer. The SPOOL APPEND command does not parse HTML tags. SET SQLPLUSCOMPAT [IBILITY] to 9.2 or earlier to disable the CREATE, APPEND, and SAVE parameters.

Using the AUTOTRACE Command

- It displays a report after the successful execution of SQL DML statements such as SELECT, INSERT, UPDATE, or DELETE.
- The report can now include execution statistics and the query execution path.

```
SET AUTOT [RACE] {ON | OFF | TRACE [ONLY] } [EXP [LAIN] ]  
[STATISTICS]
```

```
SET AUTOTRACE ON  
-- The AUTOTRACE report includes both the optimizer  
-- execution path and the SQL statement execution  
-- statistics
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

EXPLAIN shows the query execution path by performing an EXPLAIN PLAN. STATISTICS displays SQL statement statistics. The formatting of your AUTOTRACE report may vary depending on the version of the server to which you are connected and the configuration of the server. The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several predefined formats.

Note

- For additional information about the package and subprograms, refer to *Oracle Database PL/SQL Packages and Types Reference 12c*.
- For additional information about the EXPLAIN PLAN, refer to *Oracle Database SQL Reference 12c*.
- For additional information about Execution Plans and the statistics, refer to *Oracle Database Performance Tuning Guide 12c*.

Summary

In this appendix, you should have learned how to use SQL*Plus as an environment to do the following:

- Execute SQL statements
- Edit SQL statements
- Format the output
- Interact with script files

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

SQL*Plus is an execution environment that you can use to send SQL commands to the database server and to edit and save SQL commands. You can execute commands from the SQL prompt or from a script file.

Commonly Used SQL Commands

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this appendix, you should be able to:

- Execute a basic SELECT statement
- Create, alter, and drop a table using the data definition language (DDL) statements
- Insert, update, and delete rows from one or more tables using data manipulation language (DML) statements
- Commit, roll back, and create save points using the transaction control statements
- Perform join operations on one or more tables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This lesson explains how to obtain data from one or more tables using the SELECT statement, how to use DDL statements to alter the structure of data objects, how to manipulate data in the existing schema objects by using the DML statements, how to manage the changes made by DML statements, and how to use joins to display data from multiple tables using SQL:1999 join syntax.

Basic SELECT Statement

- Use the SELECT statement to:
 - Identify the columns to be displayed
 - Retrieve data from one or more tables, object tables, views, object views, or materialized views
- A SELECT statement is also known as a query because it queries a database.
- Syntax:

```
SELECT { * | [DISTINCT] column|expression [alias],... }  
      FROM    table;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In its simplest form, a SELECT statement must include the following:

- A SELECT clause, which specifies the columns to be displayed
- A FROM clause, which identifies the table containing the columns that are listed in the SELECT clause

In the syntax:

SELECT	Is a list of one or more columns
*	Selects all columns
DISTINCT	Suppresses duplicates
column / expression	Selects the named column or the expression
alias	Gives different headings to the selected columns
FROM table	Specifies the table containing the columns

Note: Throughout this course, the words *keyword*, *clause*, and *statement* are used as follows:

- A *keyword* refers to an individual SQL element—for example, SELECT and FROM are keywords.
- A *clause* is a part of a SQL statement (for example, SELECT employee_id, last_name).
- A *statement* is a combination of two or more clauses (for example, SELECT * FROM employees).

SELECT Statement

- Select all columns:

```
SELECT *
FROM job_history;
```

	EMPLOYEE_ID	START_DATE	END_DATE	JOB_ID	DEPARTMENT_ID
1	102	13-JAN-01	24-JUL-06	IT_PROG	60
2	101	21-SEP-97	27-OCT-01	AC_ACCOUNT	110
3	101	28-OCT-01	15-MAR-05	AC_MGR	110
4	201	17-FEB-04	19-DEC-07	MK_REP	20
5	114	24-MAR-06	31-DEC-07	ST_CLERK	50
6	122	01-JAN-07	31-DEC-07	ST_CLERK	50
7	200	17-SEP-95	17-JUN-01	AD_ASST	90
8	176	24-MAR-06	31-DEC-06	SA REP	80
9	176	01-JAN-07	31-DEC-07	SA_MAN	80
10	200	01-JUL-02	31-DEC-06	AC_ACCOUNT	90

- Select specific columns:

```
SELECT manager_id, job_id
FROM employees;
```

	MANAGER_ID	JOB_ID
1	(null)	AD_PRES
2	100	AD_VP
3	100	AD_VP
4	102	IT_PROG
5	103	IT_PROG
6	103	IT_PROG
7	100	ST_MAN
8	124	ST_CLERK
9	124	ST_CLERK
10	124	ST_CLERK

...

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can display all columns of data in a table by following the `SELECT` keyword with an asterisk (*) or by listing all the column names after the `SELECT` keyword. The first example in the slide displays all the rows from the `job_history` table. Specific columns of the table can be displayed by specifying the column names, separated by commas. The second example in the slide displays the `manager_id` and `job_id` columns from the `employees` table.

In the `SELECT` clause, specify the columns in the order in which you want them to appear in the output. For example, the following SQL statement displays the `location_id` column before displaying the `department_id` column:

```
SELECT location_id, department_id FROM departments;
```

Note: You can enter your SQL statement in a SQL Worksheet and click the Run Statement icon or press F9 to execute a statement in SQL Developer. The output displayed on the Results tabbed page appears as shown in the slide.

WHERE Clause

- Use the optional WHERE clause to:
 - Filter rows in a query
 - Produce a subset of rows
- Syntax:
- Example:

```
SELECT * FROM table  
[WHERE condition];
```

```
SELECT location_id from departments  
WHERE department_name = 'Marketing';
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The WHERE clause specifies a condition to filter rows, producing a subset of the rows in the table. A condition specifies a combination of one or more expressions and logical (Boolean) operators. It returns a value of TRUE, FALSE, or NULL. The example in the slide retrieves the location_id of the marketing department.

The WHERE clause can also be used to update or delete data from the database.

For example:

```
UPDATE departments  
SET department_name = 'Administration'  
WHERE department_id = 20;  
and  
DELETE from departments  
WHERE department_id =20;
```

ORDER BY Clause

- Use the optional ORDER BY clause to specify the row order.
- Syntax:

```
SELECT * FROM table  
[WHERE condition]  
[ORDER BY {<column>|<position>} [ASC|DESC] [, ...] ];
```

- Example:

```
SELECT last_name, department_id, salary  
FROM employees  
ORDER BY department_id ASC, salary DESC;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The ORDER BY clause specifies the order in which the rows should be displayed. The rows can be sorted in ascending or descending fashion. By default, the rows are displayed in ascending order.

The example in the slide retrieves rows from the EMPLOYEES table ordered first by ascending order of department_id, and then by descending order of salary.

GROUP BY Clause

- Use the optional GROUP BY clause to group columns that have matching values into subsets.
- Each group has no two rows having the same value for the grouping column or columns.
- Syntax:

```
SELECT <column1, column2, ... column_n>
  FROM table
  [WHERE condition]
  [GROUP BY <column> [, ...] ]
  [ORDER BY <column> [, ...] ] ;
```

- Example:

```
SELECT department_id, MIN(salary), MAX (salary)
  FROM employees
 GROUP BY department_id ;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The GROUP BY clause is used to group selected rows based on the value of expr (s) for each row. The clause groups rows but does not guarantee order of the result set. To order the groupings, use the ORDER BY clause.

Any SELECT list elements that are not included in aggregation functions must be included in the GROUP BY list of elements. This includes both columns and expressions. The database returns a single row of summary information for each group.

The example in the slide returns the minimum and maximum salaries for each department in the EMPLOYEES table.

Data Definition Language

- DDL statements are used to define, structurally change, and drop schema objects.
- The commonly used DDL statements are:
 - CREATE TABLE, ALTER TABLE, and DROP TABLE
 - GRANT, REVOKE
 - TRUNCATE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

DDL statements enable you to alter the attributes of an object without altering the applications that access the object. You can also use DDL statements to alter the structure of objects while database users are performing work in the database. These statements are most frequently used to:

- Create, alter, and drop schema objects and other database structures, including the database itself and database users
- Delete all the data in schema objects without removing the structure of these objects
- Grant and revoke privileges and roles

Oracle Database implicitly commits the current transaction before and after every DDL statement.

CREATE TABLE Statement

- Use the CREATE TABLE statement to create a table in the database.
- Syntax:

```
CREATE TABLE tablename (
  {column-definition | Table-level constraint}
  [ , {column-definition | Table-level constraint} ] * )
```

- Example:

```
CREATE TABLE teach_dept (
  department_id NUMBER(3) PRIMARY KEY,
  department_name VARCHAR2(10));
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use the CREATE TABLE statement to create a table in the database. To create a table, you must have the CREATE TABLE privilege and a storage area in which to create objects.

The table owner and the database owner automatically gain the following privileges on the table after it is created:

- INSERT
- SELECT
- REFERENCES
- ALTER
- UPDATE

The table owner and the database owner can grant the preceding privileges to other users.

ALTER TABLE Statement

- Use the ALTER TABLE statement to modify the definition of an existing table in the database.
- Example1:

```
ALTER TABLE teach_dept  
ADD location_id NUMBER NOT NULL;
```

- Example 2:

```
ALTER TABLE teach_dept  
MODIFY department_name VARCHAR2(30) NOT NULL;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The ALTER TABLE statement allows you to make changes to an existing table.

You can:

- Add a column to a table
- Add a constraint to a table
- Modify an existing column definition
- Drop a column from a table
- Drop an existing constraint from a table
- Increase the width of the VARCHAR and CHAR columns
- Change a table to have read-only status

Example 1 in the slide adds a new column called LOCATION_ID to the TEACH_DEPT table.

Example 2 updates the existing DEPARTMENT_NAME column from VARCHAR2 (10) to VARCHAR2 (30), and adds a NOT NULL constraint to it.

DROP TABLE Statement

- The **DROP TABLE** statement removes the table and all its data from the database.
- Example:

```
DROP TABLE teach_dept;
```

- **DROP TABLE** with the **PURGE** clause drops the table and releases the space that is associated with it.

```
DROP TABLE teach_dept PURGE;
```

- The **CASCADE CONSTRAINTS** clause drops all referential integrity constraints from the table.

```
DROP TABLE teach_dept CASCADE CONSTRAINTS;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The **DROP TABLE** statement allows you to remove a table and its contents from the database, and pushes it to the recycle bin. Dropping a table invalidates dependent objects and removes object privileges on the table.

Use the **PURGE** clause along with the **DROP TABLE** statement to release back to the tablespace the space allocated for the table. You cannot roll back a **DROP TABLE** statement with the **PURGE** clause, nor can you recover the table if you have dropped it with the **PURGE** clause.

The **CASCADE CONSTRAINTS** clause allows you to drop the reference to the primary key and unique keys in the dropped table.

GRANT Statement

- The GRANT statement assigns privilege to perform the following operations:
 - Insert or delete data.
 - Create a foreign key reference to the named table or to a subset of columns from a table.
 - Select data, a view, or a subset of columns from a table.
 - Create a trigger on a table.
 - Execute a specified function or procedure.
- Example:

```
GRANT SELECT any table to PUBLIC;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can use the GRANT statement to:

- Assign privileges to a specific user or role, or to all users, to perform actions on database objects
- Grant a role to a user, to PUBLIC, or to another role

Before you issue a GRANT statement, check that the derby.database.sqlAuthorization property is set to True. This property enables the SQL Authorization mode. You can grant privileges on an object if you are the owner of the database.

You can grant privileges to all users by using the PUBLIC keyword. When PUBLIC is specified, the privileges or roles affect all current and future users.

Privilege Types

Assign the following privileges using the GRANT statement:

- ALL PRIVILEGES
- DELETE
- INSERT
- REFERENCES
- SELECT
- UPDATE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Oracle Database provides a variety of privilege types to grant privileges to a user or role:

- Use the ALL PRIVILEGES privilege type to grant all privileges to the user or role for the specified table.
- Use the DELETE privilege type to grant permission to delete rows from the specified table.
- Use the INSERT privilege type to grant permission to insert rows into the specified table.
- Use the REFERENCES privilege type to grant permission to create a foreign key reference to the specified table.
- Use the SELECT privilege type to grant permission to perform SELECT statements on a table or view.
- Use the UPDATE privilege type to grant permission to use the UPDATE statement on the specified table.

REVOKE Statement

- Use the REVOKE statement to remove privileges from a user to perform actions on database objects.
- Revoke a *system privilege* from a user:

```
REVOKE DROP ANY TABLE  
FROM hr;
```

- Revoke a *role* from a user:

```
REVOKE dw_manager  
FROM sh;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The REVOKE statement removes privileges from a specific user (or users) or role to perform actions on database objects. It performs the following operations:

- Revokes a role from a user, from PUBLIC, or from another role
- Revokes privileges for an object if you are the owner of the object or the database owner

Note: To revoke a role or system privilege, you must have been granted the privilege with the ADMIN OPTION.

TRUNCATE TABLE Statement

- Use the TRUNCATE TABLE statement to remove all the rows from a table.
- Example:

```
TRUNCATE TABLE employees_demo;
```

- By default, Oracle Database performs the following tasks:
 - Deallocates space used by the removed rows
 - Sets the NEXT storage parameter to the size of the last extent removed from the segment by the truncation process

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The TRUNCATE TABLE statement deletes all the rows from a specific table. Removing rows with the TRUNCATE TABLE statement can be more efficient than dropping and re-creating a table. Dropping and re-creating a table:

- Invalidates the dependent objects of the table
- Requires you to regrant object privileges
- Requires you to re-create indexes, integrity constraints, and triggers
- Requires you to respecify its storage parameters

The TRUNCATE TABLE statement spares you from these efforts.

Note: You cannot roll back a TRUNCATE TABLE statement.

Data Manipulation Language

- DML statements query or manipulate data in the existing schema objects.
- A DML statement is executed when:
 - New rows are added to a table by using the `INSERT` statement
 - Existing rows in a table are modified using the `UPDATE` statement
 - Existing rows are deleted from a table by using the `DELETE` statement
- A *transaction* consists of a collection of DML statements that form a logical unit of work.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Data Manipulation Language (DML) statements enable you to query or change the contents of an existing schema object. These statements are most frequently used to:

- Add new rows of data to a table or view by specifying a list of column values or using a subquery to select and manipulate existing data
- Change column values in the existing rows of a table or view
- Remove rows from tables or views

A collection of DML statements that forms a logical unit of work is called a transaction. Unlike DDL statements, DML statements do not implicitly commit the current transaction.

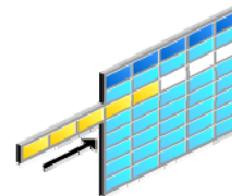

INSERT Statement

- Use the **INSERT statement** to add new rows to a table.
- Syntax:

```
INSERT INTO table [(column [, column...])]  
VALUES      (value [, value...]);
```

- Example:

```
INSERT INTO departments  
VALUES      (200, 'Development', 104, 1400);  
1 rows inserted.
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The **INSERT** statement adds rows to a table. Make sure to insert a new row containing values for each column and to list the values in the default order of the columns in the table. Optionally, you can also list the columns in the **INSERT** statement.

For example:

```
INSERT INTO job_history (employee_id, start_date, end_date,  
job_id)  
VALUES (120, '25-JUL-06', '12-FEB-08', 'AC_ACCOUNT');
```

The syntax discussed in the slide allows you to insert a single row at a time. The **VALUES** keyword assigns the values of expressions to the corresponding columns in the column list.

UPDATE Statement Syntax

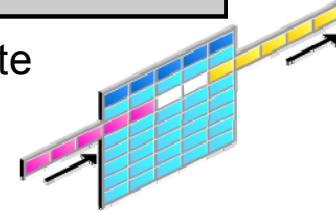

- Use the UPDATE statement to modify the existing rows in a table.
- Update more than one row at a time (if required).

```
UPDATE      table  
SET         column = value [, column = value, ...]  
[WHERE      condition];
```

- Example:

```
UPDATE      copy_emp  
SET  
22 rows updated
```

- Specify SET *column_name*= NULL to update a column value to NULL.

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The UPDATE statement modifies the existing values in a table. Confirm the update operation by querying the table to display the updated rows. You can modify a specific row or rows by specifying the WHERE clause.

For example:

```
UPDATE employees  
SET     salary = 17500  
WHERE   employee_id = 102;
```

In general, use the primary key column in the WHERE clause to identify the row to update. For example, to update a specific row in the EMPLOYEES table, use *employee_id* to identify the row instead of *employee_name*, because more than one employee may have the same name.

Note: Typically, the condition keyword is composed of column names, expressions, constants, subqueries, and comparison operators.

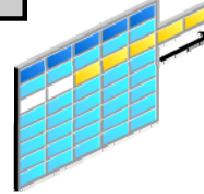

DELETE Statement

- Use the DELETE statement to delete the existing rows from a table.
- Syntax:

```
DELETE      [FROM]      table  
[WHERE]      condition ;
```

- Write the DELETE statement using the WHERE clause to delete specific rows from a table.

```
DELETE FROM departments  
WHERE department_name = 'Finance';  
1 rows deleted
```

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The DELETE statement removes existing rows from a table. You must use the WHERE clause to delete a specific row or rows from a table based on the condition. The condition identifies the rows to be deleted. It may contain column names, expressions, constants, subqueries, and comparison operators.

The first example in the slide deletes the finance department from the DEPARTMENTS table. You can confirm the delete operation by using the SELECT statement to query the table.

```
SELECT *  
FROM   departments  
WHERE  department_name = 'Finance';
```

If you omit the WHERE clause, all rows in the table are deleted. For example:

```
DELETE FROM copy_emp;
```

The preceding example deletes all the rows from the COPY_EMP table.

Transaction Control Statements

- Transaction control statements are used to manage the changes made by DML statements.
- The DML statements are grouped into transactions.
- Transaction control statements include:
 - COMMIT
 - ROLLBACK
 - SAVEPOINT

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

A transaction is a sequence of SQL statements that Oracle Database treats as a single unit. Transaction control statements are used in a database to manage the changes made by DML statements and to group these statements into transactions.

Each transaction is assigned a unique `transaction_id` and it groups SQL statements so that they are either all committed, which means they are applied to the database, or all rolled back, which means they are undone from the database.

COMMIT Statement

- Use the COMMIT statement to:
 - Permanently save the changes made to the database during the current transaction
 - Erase all savepoints in the transaction
 - Release transaction locks
- Example:

```
INSERT INTO departments
VALUES      (201, 'Engineering', 106, 1400);
COMMIT;

1 rows inserted.
committed.
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The COMMIT statement ends the current transaction by making all the pending data changes permanent. It releases all row and table locks, and erases any savepoints that you may have marked since the last commit or rollback. The changes made using the COMMIT statement are visible to all users.

Oracle recommends that you explicitly end every transaction in your application programs with a COMMIT or ROLLBACK statement, including the last transaction, before disconnecting from Oracle Database. If you do not explicitly commit the transaction and the program terminates abnormally, the last uncommitted transaction is automatically rolled back.

Note: Oracle Database issues an implicit COMMIT before and after any data definition language (DDL) statement.

ROLLBACK Statement

- Use the ROLLBACK statement to undo changes made to the database during the current transaction.
- Use the TO SAVEPOINT clause to undo a part of the transaction after the savepoint.
- Example:

```
UPDATE      employees
SET          salary = 7000
WHERE        last_name = 'Ernst';
SAVEPOINT   Ernst_sal;

UPDATE      employees
SET          salary = 12000
WHERE        last_name = 'Mourgos';

ROLLBACK TO SAVEPOINT Ernst_sal;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The ROLLBACK statement undoes work done in the current transaction. To roll back the current transaction, no privileges are necessary.

Using ROLLBACK with the TO SAVEPOINT clause performs the following operations:

- Rolls back only the portion of the transaction after the savepoint
- Erases all savepoints created after that savepoint. The named savepoint is retained, so you can roll back to the same savepoint multiple times.

Using ROLLBACK without the TO SAVEPOINT clause performs the following operations:

- Ends the transaction
- Undoes all the changes in the current transaction
- Erases all savepoints in the transaction

SAVEPOINT Statement

- Use the SAVEPOINT statement to name and mark the current point in the processing of a transaction.
- Specify a name to each savepoint.
- Use distinct savepoint names within a transaction to avoid overriding.
- Syntax:

```
SAVEPOINT savepoint;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The SAVEPOINT statement identifies a point in a transaction to which you can later roll back. You must specify a distinct name for each savepoint. If you create a second savepoint with the same identifier as an earlier savepoint, the earlier savepoint is erased.

After a savepoint has been created, you can continue processing, commit your work, roll back the entire transaction, or roll back to the savepoint.

A simple rollback or commit erases all savepoints. When you roll back to a savepoint, any savepoints marked after that savepoint are erased. The savepoint to which you have rolled back is retained.

When savepoint names are reused within a transaction, the Oracle Database moves (overrides) the save point from its old position to the current point in the transaction.

Joins

Use a join to query data from more than one table:

```
SELECT      table1.column, table2.column  
FROM        table1, table2  
WHERE       table1.column1 = table2.column2;
```

- Write the join condition in the WHERE clause.
- Prefix the column name with the table name when the same column name appears in more than one table.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When data from more than one table in the database is required, a *join* condition is used. Rows in one table can be joined to rows in another table according to common values that exist in the corresponding columns (usually primary and foreign key columns).

To display data from two or more related tables, write a simple join condition in the WHERE clause.

In the syntax:

<i>table1.column</i>	Denotes the table and column from which data is retrieved
<i>table1.column1</i> = <i>table2.column2</i>	Is the condition that joins (or relates) the tables together

Guidelines

- When writing a SELECT statement that joins tables, precede the column name with the table name for clarity and to enhance database access.
- If the same column name appears in more than one table, the column name must be prefixed with the table name.
- To join n tables together, you need a minimum of $n-1$ join conditions. For example, to join four tables, a minimum of three joins is required. This rule may not apply if your table has a concatenated primary key, in which case more than one column is required to uniquely identify each row.

Types of Joins

- Natural join
- Equijoin
- Nonequijoin
- Outer join
- Self-join
- Cross join

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

To join tables, you can use Oracle's join syntax.

Note: Before the Oracle9i release, the join syntax was proprietary. The SQL:1999-compliant join syntax does not offer any performance benefits over the Oracle-proprietary join syntax.

Qualifying Ambiguous Column Names

- Use table prefixes to qualify column names that are in multiple tables.
- Use table prefixes to improve performance.
- Use table aliases, instead of full table name prefixes.
- Table aliases give a table a shorter name.
 - This keeps SQL code smaller and uses less memory.
- Use column aliases to distinguish columns that have identical names, but reside in different tables.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

When joining two or more tables, you need to qualify the names of the columns with the table name to avoid ambiguity. Without the table prefixes, the DEPARTMENT_ID column in the SELECT list could be from either the DEPARTMENTS table or the EMPLOYEES table. Therefore, it is necessary to add the table prefix to execute your query. If there are no common column names between the two tables, there is no need to qualify the columns. However, using a table prefix improves performance, because you tell the Oracle server exactly where to find the columns.

Qualifying column names with table names can be very time consuming, particularly if table names are lengthy. Therefore, you can use *table aliases*, instead of table names. Just as a column alias gives a column another name, a table alias gives a table another name. Table aliases help to keep SQL code smaller, thereby using less memory.

The table name is specified in full, followed by a space, and then the table alias. For example, the EMPLOYEES table can be given an alias of *e*, and the DEPARTMENTS table an alias of *d*.

Guidelines

- Table aliases can be up to 30 characters in length, but shorter aliases are better than longer ones.
- If a table alias is used for a particular table name in the `FROM` clause, that table alias must be substituted for the table name throughout the `SELECT` statement.
- Table aliases should be meaningful.
- A table alias is valid only for the current `SELECT` statement.

Natural Join

- The NATURAL JOIN clause is based on all the columns in the two tables that have the same name.
- It selects rows from tables that have the same names and data values of columns.
- Example:

```
SELECT country_id, location_id, country_name, city  
FROM countries NATURAL JOIN locations;
```

	COUNTRY_ID	LOCATION_ID	COUNTRY_NAME	CITY
1	US	1400	United States of America	Southlake
2	US	1500	United States of America	South San Francisco
3	US	1700	United States of America	Seattle
4	CA	1800	Canada	Toronto
5	UK	2500	United Kingdom	Oxford

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You can join tables automatically based on the columns in the two tables that have matching data types and names. You do this by using the NATURAL JOIN keywords.

Note: The join can happen only on those columns that have the same names and data types in both tables. If the columns have the same name but different data types, the NATURAL JOIN syntax causes an error.

In the example in the slide, the COUNTRIES table is joined to the LOCATIONS table by the COUNTRY_ID column, which is the only column of the same name in both tables. If other common columns were present, the join would have used them all.

Equijoins

EMPLOYEES

	EMPLOYEE_ID	DEPARTMENT_ID
1	200	10
2	201	20
3	202	20
4	205	110
5	206	110
6	100	90
7	101	90
8	102	90
9	103	60
10	104	60
...		

DEPARTMENTS

	DEPARTMENT_ID	DEPARTMENT_NAME
1	10	Administration
2	20	Marketing
3	50	Shipping
4	60	IT
5	80	Sales
6	90	Executive
7	110	Accounting
8	190	Contracting

Foreign key

Primary key

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

An **equijoin** is a join with a join condition containing an equality operator. An equijoin combines rows that have equivalent values for the specified columns. To determine an employee's department name, you compare the values in the `DEPARTMENT_ID` column in the `EMPLOYEES` table with the `DEPARTMENT_ID` values in the `DEPARTMENTS` table. The relationship between the `EMPLOYEES` and `DEPARTMENTS` tables is an *equijoin*; that is, values in the `DEPARTMENT_ID` column in both tables must be equal. Often, this type of join involves primary and foreign key complements.

Note: Equijoins are also called *simple joins*.

Retrieving Records with Equijoins

```
SELECT e.employee_id, e.last_name, e.department_id,
       d.department_id, d.location_id
  FROM employees e JOIN departments d
 WHERE e.department_id = d.department_id;
```

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID	DEPARTMENT_ID_1	LOCATION_ID
1	200 Whalen	10	10	1700
2	201 Hartstein	20	20	1800
3	202 Fay	20	20	1800
4	144 Vargas	50	50	1500
5	143 Matos	50	50	1500
6	142 Davies	50	50	1500
7	141 Rajs	50	50	1500
8	124 Mourgos	50	50	1500
9	103 Hunold	60	60	1400
10	104 Ernst	60	60	1400
11	107 Lorentz	60	60	1400
...				

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide:

- **The SELECT clause specifies the column names to retrieve:**
 - Employee last name, employee ID, and department ID, which are columns in the EMPLOYEES table
 - Department ID and location ID, which are columns in the DEPARTMENTS table
- **The FROM clause specifies the two tables that the database must access:**
 - EMPLOYEES table
 - DEPARTMENTS table
- **The WHERE clause specifies how the tables are to be joined:**

e.department_id = d.department_id

Because the DEPARTMENT_ID column is common to both tables, it must be prefixed with the table alias to avoid ambiguity. Other columns that are not present in both the tables need not be qualified by a table alias, but it is recommended for better performance.

Note: When you use the Execute Statement icon to run the query, SQL Developer suffixes a “_1” to differentiate between the two DEPARTMENT_IDS.

Additional Search Conditions Using the AND and WHERE Operators

```
SELECT d.department_id, d.department_name, l.city
FROM departments d JOIN locations l
ON d.location_id = l.location_id
AND d.department_id IN (20, 50);
```

```
DEPARTMENT_ID DEPARTMENT_NAME CITY
1 20 Marketing Toronto
2 50 Shipping South San Francisco
```

```
SELECT d.department_id, d.department_name, l.city
FROM departments d JOIN locations l
ON d.location_id = l.location_id
WHERE d.department_id IN (20, 50);
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In addition to the join, you may have criteria for your WHERE clause to restrict the rows in consideration for one or more tables in the join. The example in the slide performs a join on the DEPARTMENTS and LOCATIONS tables and, in addition, displays only those departments with ID equal to 20 or 50. To add additional conditions to the ON clause, you can add AND clauses. Alternatively, you can use a WHERE clause to apply additional conditions.

Both queries produce the same output.

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
Matos	50	Shipping

Retrieving Records with Nonequijoins

```
SELECT e.last_name, e.salary, j.grade_level
FROM   employees e JOIN job_grades j
ON    e.salary
      BETWEEN j.lowest_sal AND j.highest_sal;
```

#	LAST_NAME	SALARY	GRADE_LEVEL
1	Vargas	2500	A
2	Matos	2600	A
3	Davies	3100	B
4	Rajs	3500	B
5	Lorentz	4200	B
6	Whalen	4400	B
7	Fay	6000	C

...

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide creates a nonequijoin to evaluate an employee's salary grade. The salary must be *between* any pair of the low and high salary ranges.

It is important to note that all employees appear exactly once when this query is executed. No employee is repeated in the list. There are two reasons for this:

- None of the rows in the job grade table contain grades that overlap. That is, the salary value for an employee can lie only between the low salary and high salary values of one of the rows in the salary grade table.
- All of the employees' salaries lie within the limits that are provided by the job grade table. That is, no employee earns less than the lowest value contained in the LOWEST_SAL column or more than the highest value contained in the HIGHEST_SAL column.

Note: Other conditions (such as `<=` and `>=`) can be used, but `BETWEEN` is the simplest. Remember to specify the low value first and the high value last when using the `BETWEEN` condition. The Oracle server translates the `BETWEEN` condition to a pair of `AND` conditions. Therefore, using `BETWEEN` has no performance benefits, but should be used only for logical simplicity.

Table aliases have been specified in the example in the slide for performance reasons, not because of possible ambiguity.

Retrieving Records by Using the USING Clause

- You can use the USING clause to match only one column when more than one column matches.
- You cannot specify this clause with a NATURAL join.
- Do not qualify the column name with a table name or table alias.
- Example:

```
SELECT country_id, country_name, location_id, city
FROM   countries JOIN locations
USING (country_id) ;
```

COUNTRY_ID	COUNTRY_NAME	LOCATION_ID	CITY
1 US	United States of America	1400	Southlake
2 US	United States of America	1500	South San Francisco
3 US	United States of America	1700	Seattle
4 CA	Canada	1800	Toronto
5 UK	United Kingdom	2500	Oxford

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

In the example in the slide, the COUNTRY_ID columns in the COUNTRIES and LOCATIONS tables are joined and thus the LOCATION_ID of the location where an employee works is shown.

Retrieving Records by Using the ON Clause

- The join condition for the natural join is basically an equijoin of all columns with the same name.
- Use the ON clause to specify arbitrary conditions or specify columns to join.
- The ON clause makes code easy to understand.

```
SELECT e.employee_id, e.last_name, j.department_id,  
      FROM employees e JOIN job_history j  
      ON (e.employee_id = j.employee_id);
```

	EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID
1	101	Kochhar	110
2	101	Kochhar	110
3	102	De Haan	60
4	176	Taylor	80
5	176	Taylor	80
6	200	Whalen	90
7	200	Whalen	90
8	201	Hartstein	20

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Use the ON clause to specify a join condition. With this, you can specify join conditions separate from any search or filter conditions in the WHERE clause.

In this example, the EMPLOYEE_ID columns in the EMPLOYEES and JOB_HISTORY tables are joined using the ON clause. Wherever an employee ID in the EMPLOYEES table equals an employee ID in the JOB_HISTORY table, the row is returned. The table alias is necessary to qualify the matching column names.

You can also use the ON clause to join columns that have different names. The parentheses around the joined columns, as in the example in the slide, (e.employee_id = j.employee_id), is optional. So, even ON e.employee_id = j.employee_id will work.

Note: When you use the Execute Statement icon to run the query, SQL Developer suffixes a '_1' to differentiate between the two employee_ids.

Left Outer Join

- A join between two tables that returns all matched rows, as well as the unmatched rows from the left table is called a LEFT OUTER JOIN.
- Example:

```
SELECT c.country_id, c.country_name, l.location_id, l.city
FROM   countries c LEFT OUTER JOIN locations l
ON    (c.country_id = l.country_id) ;
```

	COUNTRY_ID	COUNTRY_NAME	LOCATION_ID	CITY
1	CA	Canada	1800	Toronto
2	DE	Germany	(null)	(null)
3	UK	United Kingdom	2500	Oxford
4	US	United States of America	1400	Southlake
5	US	United States of America	1500	South San Francisco
6	US	United States of America	1700	Seattle

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This query retrieves all the rows in the COUNTRIES table, which is the left table, even if there is no match in the LOCATIONS table.

Right Outer Join

- A join between two tables that returns all matched rows, as well as the unmatched rows from the right table is called a RIGHT OUTER JOIN.
- Example:

```
SELECT d.department_id, d.department_name, l.location_id,  
       l.city  
FROM   departments d RIGHT OUTER JOIN locations l  
ON    (d.location_id = l.location_id) ;
```

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID	CITY
1	10 Administration	1700	Seattle
2	20 Marketing	1800	Toronto
3	30 Purchasing	1700	Seattle
4	40 Human Resources	2400	London
...			

26	260 Recruiting	1700	Seattle
27	270 Payroll	1700	Seattle
28	(null) (null)	2000	Beijing
29	(null) (null)	3000	Bern

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This query retrieves all the rows in the LOCATIONS table, which is the right table, even if there is no match in the COUNTRIES table.

Full Outer Join

- A join between two tables that returns all matched rows, as well as the unmatched rows from both tables is called a FULL OUTER JOIN.
- Example:

```
SELECT e.last_name, d.department_id, d.manager_id,
       d.department_name
  FROM employees e FULL OUTER JOIN departments d
 WHERE (e.manager_id = d.manager_id) ;
```

LAST_NAME	DEPARTMENT_ID	MANAGER_ID	DEPARTMENT_NAME
King	(null)	(null)	(null)
Kochhar	90	100	Executive
De Haan	90	100	Executive
Hunold	(null)	(null)	(null)

...
106 Higgins
107 Gietz
108 (null)
109 (null)

...
106 Higgins

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

This query retrieves all the rows in the EMPLOYEES table, even if there is no match in the DEPARTMENTS table. It also retrieves all the rows in the DEPARTMENTS table, even if there is no match in the EMPLOYEES table.

Self-Join: Example

```
SELECT worker.last_name || ' works for '
    || manager.last_name
FROM employees worker JOIN employees manager
ON worker.manager_id = manager.employee_id
ORDER BY worker.last_name;
```

WORKER.LAST_NAME 'WORKSFOR' MANAGER.LAST_NAME
1 Abel works for Zlotkey
2 Davies works for Mourgos
3 De Haan works for King
4 Ernst works for Hunold
5 Fay works for Hartstein
6 Gietz works for Higgins
7 Grant works for Zlotkey
8 Hartstein works for King
9 Higgins works for Kochhar

...

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Sometimes you need to join a table to itself. To find the name of each employee's manager, you need to join the EMPLOYEES table to itself, or perform a self-join. The example in the slide joins the EMPLOYEES table to itself. To simulate two tables in the FROM clause, there are two aliases, namely worker and manager, for the same table, EMPLOYEES.

In this example, the WHERE clause contains the join that means “where a worker's manager ID matches the employee ID for the manager.”

Cross Join

- A CROSS JOIN is a JOIN operation that produces the Cartesian product of two tables.
- Example:

```
SELECT department_name, city  
FROM department CROSS JOIN location;
```

DEPARTMENT_NAME	CITY
1 Administration	Oxford
2 Administration	Seattle
3 Administration	South San Francisco
4 Administration	Southlake
5 Administration	Toronto
6 Marketing	Oxford
7 Marketing	Seattle
8 Marketing	South San Francisco
9 Marketing	Southlake
10 Marketing	Toronto

...

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The CROSS JOIN syntax specifies the cross product. It is also known as a Cartesian product. A cross join produces the cross product of two relations, and is essentially the same as the comma-delimited Oracle Database notation.

You do not specify any WHERE condition between the two tables in the CROSS JOIN.

Summary

In this appendix, you should have learned how to use:

- The SELECT statement to retrieve rows from one or more tables
- DDL statements to alter the structure of objects
- DML statements to manipulate data in the existing schema objects
- Transaction control statements to manage the changes made by DML statements
- Joins to display data from multiple tables

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

There are many commonly used commands and statements in SQL. It includes the DDL statements, DML statements, transaction control statements, and joins.

REF Cursors

ORACLE

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Cursor Variables

- Cursor variables are like C or Pascal pointers, which hold the memory location (address) of an item instead of the item itself.
- In PL/SQL, a pointer is declared as REF X, where REF is short for REFERENCE and X stands for a class of objects.
- A cursor variable has the data type REF CURSOR.
- A cursor is static, but a cursor variable is dynamic.
- Cursor variables give you more flexibility.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

Cursor variables are like C or Pascal pointers, which hold the memory location (address) of an item instead of the item itself. Thus, declaring a cursor variable creates a pointer, not an item. In PL/SQL, a pointer has the data type REF X, where REF is short for REFERENCE and X stands for a class of objects. A cursor variable has the REF CURSOR data type.

Like a cursor, a cursor variable points to the current row in the result set of a multirow query. However, cursors differ from cursor variables the way constants differ from variables. A cursor is static, but a cursor variable is dynamic because it is not tied to a specific query. You can open a cursor variable for any type-compatible query. This gives you more flexibility.

Cursor variables are available to every PL/SQL client. For example, you can declare a cursor variable in a PL/SQL host environment such as an OCI or Pro*C program, and then pass it as an input host variable (bind variable) to PL/SQL. Moreover, application development tools such as Oracle Forms and Oracle Reports, which have a PL/SQL engine, can use cursor variables entirely on the client side. The Oracle Server also has a PL/SQL engine. You can pass cursor variables back and forth between an application and server through remote procedure calls (RPCs).

Using Cursor Variables

- You can use cursor variables to pass query result sets between PL/SQL stored subprograms and various clients.
- PL/SQL can share a pointer to the query work area in which the result set is stored.
- You can pass the value of a cursor variable freely from one scope to another.
- You can reduce network traffic by having a PL/SQL block open (or close) several host cursor variables in a single roundtrip.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You use cursor variables to pass query result sets between PL/SQL stored subprograms and various clients. Neither PL/SQL nor any of its clients owns a result set; they simply share a pointer to the query work area in which the result set is stored. For example, an OCI client, an Oracle Forms application, and the Oracle Server can all refer to the same work area.

A query work area remains accessible as long as any cursor variable points to it. Therefore, you can pass the value of a cursor variable freely from one scope to another. For example, if you pass a host cursor variable to a PL/SQL block that is embedded in a Pro*C program, the work area to which the cursor variable points remains accessible after the block completes.

If you have a PL/SQL engine on the client side, calls from the client to the server impose no restrictions. For example, you can declare a cursor variable on the client side, open and fetch from it on the server side, and then continue to fetch from it back on the client side. Also, you can reduce network traffic by having a PL/SQL block open (or close) several host cursor variables in a single roundtrip.

A cursor variable holds a reference to the cursor work area in the Program Global Area (PGA) instead of addressing it with a static name. Because you address this area by a reference, you gain the flexibility of a variable.

Defining REF CURSOR Types

Define a REF CURSOR type:

```
Define a REF CURSOR type  
TYPE ref_type_name IS REF CURSOR [RETURN return_type] ;
```

Declare a cursor variable of that type:

```
ref_cv ref_type_name;
```

Example:

```
DECLARE  
TYPE DeptCurTyp IS REF CURSOR RETURN  
departments%ROWTYPE;  
dept_cv DeptCurTyp;
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

To define a REF CURSOR, you perform two steps. First, you define a REF CURSOR type, and then you declare cursor variables of that type. You can define REF CURSOR types in any PL/SQL block, subprogram, or package using the following syntax:

```
TYPE ref_type_name IS REF CURSOR [RETURN return_type] ;
```

where:

ref_type_name Is a type specifier used in subsequent declarations of cursor variables

return_type Represents a record or a row in a database table

In this example, you specify a return type that represents a row in the database table DEPARTMENT.

REF CURSOR types can be strong (restrictive) or weak (nonrestrictive). As the next example shows, a strong REF CURSOR type definition specifies a return type, but a weak definition does not:

```
DECLARE
```

```
TYPE EmpCurTyp IS REF CURSOR RETURN employees%ROWTYPE; -- strong
```

```
TYPE GenericCurTyp IS REF CURSOR; -- weak
```

Strong REF CURSOR types are less error prone because the PL/SQL compiler lets you associate a strongly typed cursor variable only with type-compatible queries. However, weak REF CURSOR types are more flexible because the compiler lets you associate a weakly typed cursor variable with any query.

Declaring Cursor Variables

After you define a REF CURSOR type, you can declare cursor variables of that type in any PL/SQL block or subprogram. In the following example, you declare the cursor variable DEPT_CV:

```
DECLARE
```

```
    TYPE DeptCurTyp IS REF CURSOR RETURN departments%ROWTYPE;
    dept_cv DeptCurTyp; -- declare cursor variable
```

Note: You cannot declare cursor variables in a package. Unlike packaged variables, cursor variables do not have persistent states. Remember, declaring a cursor variable creates a pointer, not an item. Cursor variables cannot be saved in the database; they follow the usual scoping and instantiation rules.

In the RETURN clause of a REF CURSOR type definition, you can use %ROWTYPE to specify a record type that represents a row returned by a strongly (not weakly) typed cursor variable, as follows:

```
DECLARE
```

```
    TYPE TmpCurTyp IS REF CURSOR RETURN employees%ROWTYPE;
    tmp_cv TmpCurTyp; -- declare cursor variable
    TYPE EmpCurTyp IS REF CURSOR RETURN tmp_cv%ROWTYPE;
    emp_cv EmpCurTyp; -- declare cursor variable
```

Similarly, you can use %TYPE to provide the data type of a record variable, as the following example shows:

```
DECLARE
```

```
    dept_rec departments%ROWTYPE; -- declare record variable
    TYPE DeptCurTyp IS REF CURSOR RETURN dept_rec%TYPE;
    dept_cv DeptCurTyp; -- declare cursor variable
```

In the final example, you specify a user-defined RECORD type in the RETURN clause:

```
DECLARE
```

```
    TYPE EmpRecTyp IS RECORD (
        empno NUMBER(4),
        ename VARCHAR2(10),
        sal    NUMBER(7,2));
    TYPE EmpCurTyp IS REF CURSOR RETURN EmpRecTyp;
    emp_cv EmpCurTyp; -- declare cursor variable
```

Cursor Variables as Parameters

You can declare cursor variables as the formal parameters of functions and procedures. In the following example, you define the REF CURSOR type EmpCurTyp, and then declare a cursor variable of that type as the formal parameter of a procedure:

```
DECLARE  
  TYPE EmpCurTyp IS REF CURSOR RETURN emp%ROWTYPE;  
  PROCEDURE open_emp_cv (emp_cv IN OUT EmpCurTyp) IS ...
```

Using the OPEN - FOR, FETCH, and CLOSE Statements

- The OPEN - FOR statement associates a cursor variable with a multirow query, executes the query, identifies the result set, and positions the cursor to point to the first row of the result set.
- The FETCH statement returns a row from the result set of a multirow query, assigns the values of the select-list items to the corresponding variables or fields in the INTO clause, increments the count kept by %ROWCOUNT, and advances the cursor to the next row.
- The CLOSE statement disables a cursor variable.

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

You use three statements to process a dynamic multirow query: OPEN - FOR, FETCH, and CLOSE. First, you “open” a cursor variable “for” a multirow query. Then you “fetch” rows from the result set one at a time. When all the rows are processed, you “close” the cursor variable.

Opening the Cursor Variable

The OPEN - FOR statement associates a cursor variable with a multirow query, executes the query, identifies the result set, positions the cursor to point to the first row of the results set, and then sets the rows-processed count kept by %ROWCOUNT to zero. Unlike the static form of OPEN - FOR, the dynamic form has an optional USING clause. At run time, bind arguments in the USING clause replace corresponding placeholders in the dynamic SELECT statement. The syntax is:

```
OPEN {cursor_variable | :host_cursor_variable} FOR  
dynamic_string  
      [USING bind_argument [, bind_argument] ...];
```

where CURSOR_VARIABLE is a weakly typed cursor variable (one without a return type), HOST_CURSOR_VARIABLE is a cursor variable declared in a PL/SQL host environment such as an OCI program, and dynamic_string is a string expression that represents a multirow query.

In the following example, the syntax declares a cursor variable, and then associates it with a dynamic SELECT statement that returns rows from the EMPLOYEES table:

```

DECLARE
  TYPE EmpCurTyp IS REF CURSOR; -- define weak REF CURSOR      type
  emp_cv  EmpCurTyp; -- declare cursor variable
  my_ename VARCHAR2(15);
  my_sal   NUMBER := 1000;
BEGIN
  OPEN emp_cv FOR -- open cursor variable
    'SELECT last_name, salary FROM employees WHERE salary >
     :s'
    USING my_sal;
  ...
END;

```

Any bind arguments in the query are evaluated only when the cursor variable is opened. Thus, to fetch rows from the cursor using different bind values, you must reopen the cursor variable with the bind arguments set to their new values each time.

Fetching from the Cursor Variable

The FETCH statement returns a row from the result set of a multirow query, assigns the values of the select-list items to the corresponding variables or fields in the INTO clause, increments the count kept by %ROWCOUNT, and advances the cursor to the next row. Use the following syntax:

```

FETCH {cursor_variable | :host_cursor_variable}
  INTO {define_variable[, define_variable]... | record};

```

Continuing the example, fetch rows from the cursor variable `emp_cv` into the define variables `MY_ENAME` and `MY_SAL`:

```

LOOP
  FETCH emp_cv INTO my_ename, my_sal; -- fetch next row
  EXIT WHEN emp_cv%NOTFOUND; -- exit loop when last row is
    fetched
  -- process row
END LOOP;

```

For each column value returned by the query associated with the cursor variable, there must be a corresponding, type-compatible variable or field in the INTO clause. You can use a different INTO clause on separate fetches with the same cursor variable. Each fetch retrieves another row from the same result set. If you try to fetch from a closed or never-opened cursor variable, PL/SQL raises the predefined exception `INVALID_CURSOR`.

Closing the Cursor Variable

The CLOSE statement disables a cursor variable. After that, the associated result set is undefined. Use the following syntax:

```
CLOSE {cursor_variable | :host_cursor_variable};
```

In this example, when the last row is processed, close the emp_cv cursor variable:

```
LOOP  
  FETCH emp_cv INTO my_ename, my_sal;  
  EXIT WHEN emp_cv%NOTFOUND;  
  -- process row  
END LOOP;  
CLOSE emp_cv; -- close cursor variable
```

If you try to close an already-closed or never-opened cursor variable, PL/SQL raises INVALID_CURSOR.

Example of Fetching

```
DECLARE
    TYPE EmpCurTyp IS REF CURSOR;
    emp_cv    EmpCurTyp;
    emp_rec   employees%ROWTYPE;
    sql_stmt  VARCHAR2(200);
    my_job    VARCHAR2(10) := 'ST_CLERK';
BEGIN
    sql_stmt := 'SELECT * FROM employees
                 WHERE job_id = :j';
    OPEN emp_cv FOR sql_stmt USING my_job;
    LOOP
        FETCH emp_cv INTO emp_rec;
        EXIT WHEN emp_cv%NOTFOUND;
        -- process record
    END LOOP;
    CLOSE emp_cv;
END;
/
```

Copyright © 2013, Oracle and/or its affiliates. All rights reserved.

The example in the slide shows that you can fetch rows from the result set of a dynamic multirow query into a record. You must first define a REF CURSOR type, EmpCurTyp. You then define a cursor variable emp_cv, of the type EmpcurTyp. In the executable section of the PL/SQL block, the OPEN-FOR statement associates the cursor variable emp_cv with the multirow query, sql_stmt. The FETCH statement returns a row from the result set of a multirow query and assigns the values of the select-list items to EMP_REC in the INTO clause. When the last row is processed, close the emp_cv cursor variable.
